Ayeri is a fictional language spoken by fictional people in a fictional setting, and as such is not related to any naturally existing languages. It is thus not to be confused with *Azeri*, a Turkic language spoken in Azerbaijan and its surrounding countries. Ayeri's vocabulary is entirely a priori, this means, no real-world languages have been used specifically as sources of vocabulary. Due to the language's sound and spelling aesthetic being inspired by Austronesian languages, it is not surprising if overlaps with existing words in those languages happen accidentally.

Preface

This is my latest attempt to write a grammar of Ayeri, a fictional language which I have been developing since December 2003. Getting to work on grammar writing again was triggered by a growing dissatisfaction with not having a central place of documentation, when the first thing people look for on my website is often the grammar, incomplete as well as partially inaccurate and outdated as it may be. In addition to that, there was a seminar on fictional languages at the University of Tübingen, Germany, in the summer semester of 2016 (Buch 2016). Ayeri was one of the languages that was chosen for students to explore and evaluate.

The student group who worked on Ayeri came to the conclusion that its documentation is severely lacking in the description of basic elements and assumptions, since whole chapters of the grammar had been missing to date (Boga et al. 2016: 12).¹ This is to say that previous attempts of writing a full-fledged grammar of Ayeri have been incomplete due to loss of enthusiasm and creeping neglect.

Although the *Ayeri Grammar* has so far been lying dormant for five years, I have written a whole number of blog articles detailing various grammatical issues (Becker 2016: Blog). These articles have been taken into consideration here. This grammar writing attempt is thus not only a transferral to a different typesetting system, but constitutes an extension to previous formal documentation as well.

I hope that by transferring my previous grammar writing from LibreOffice to L^AT_EX, combined with using GitHub as a version control system, maintaining and editing will become faster, more transparent, and more elegant, since L^AT_EX operates on plain text files, and version control helps in keeping track of changes over time.

Carsten Becker
Marburg, July 18, 2016

¹  *Kutānas-ikan* ‘thanks a lot’ to Bella Boga, Madita Breuninger, Thora Daneyko, and Martina Stama-Kirr for their hard work on making sense of my published materials in spite of information being scattered all over the place, as well as their providing me with the presentation concluding their group work.

o Introduction

In December 2003, the idea for a new fictional language was born, an idea that turned out to stick with me for over 10 years now.¹ At that time, my seventeen years old self was still fairly new to this whole making-up languages business, read things about linguistics here and there, and was not shy to ask questions about terminology (and, looking at old mails, a little impertinently teenager-like so), for example on *Conlang-L* and the *Zompist Bulletin Board*. One thing seemed to catch my interest especially: syntactic alignments other than the NOM/ACC of the few languages I was familiar with, that is, German, English, and French. Apparently this curiosity was big enough for me to grow bored with my second fictional language, Daléian (declared ‘quite complete’ after maybe half a year of work or so), and to start something new from scratch in order to put newly acquired knowledge to test.

I had read about “trigger languages” on *Conlang-L* and wanted to try my hands on making my own. I cannot remember how long it took me to come up with a first draft of an Ayeri grammar, however, I do remember having been told that a good language cannot be made in a summer. Of course, I still did not really know what I was doing then, even though I thought I had understood things and authoritatively declared “this is how it works” in my first grammar draft when things sometimes really do not work that way. But at least an interest had been whetted.

In order to illustrate the various stages from the beginnings to current Ayeri, I went through some old backups contemporary with the very early days. Here is a sentence from the oldest existing document related to it, titled “Draft of & Ideas for my 3rd Conlang”—the file’s last-changed date is December 14, 2003, though I remember having started work on Ayeri in early December. I added glossing for convenience and according to what I could reconstruct from the notes. This uses vocabulary and grammatical markers just made up on the spot and for illustrative purposes; little of it actually managed to make it into actual work on Ayeri:

¹ Most of the text here is taken from the blog article, “Happy 10th anniversary, Ayeri!” (Becker 2013) with some slight rephrasings and extensions.

- (1) *Ayevhoi agiaemaesim coyaieliēdamavir vhaieloyajaiye.*
 Ay-evhoi agia-ema-esim coyai-el-i-eđam-avir vhai-el-o-yaŋa-iyē
 3SG.AN-SBJ read-VB-SBJ.AN book-NN-AN-INDF-P bed-NN-INAN-on-LOC
 ‘He reads a book on the bed.’

According to the grammar draft of September 5, 2004, this would have already changed to:

- (2) *Ang layaiyain mecoyalei ling *pinamea.*
 Ang laya-iy-a-in me-coya-lei ling *pinam-ea
 A.SBJ read-3SG.AN₁-a₁-SBJ INDF.INAN-book-P.INAN top.of bed-LOC
 ‘He reads a book on the bed.’

A word for ‘bed’—*pinam*—was only (re-)introduced on October 24, 2008, however. In the current state of Ayeri, I would translate the sentence as follows:

- (3) *Ang layaya koyaley ling pinamya.*
 Ang laya=ya.Ø koya-ley ling pinam-ya
 AT read=3SG.M.TOP book-P.INAN top.of bed-LOC
 ‘He reads a book on a/the bed.’

As you can see, quite a bit of morphology got lost already early on, especially the overt part-of-speech marking (!) and animacy marking on nouns. Also, prepositions were just incorporated into a noun complex as suffixes apparently. Gender was originally only divided into animate and inanimate, but I changed that at some point because only being really familiar with European languages, it felt awkward to me not to be able to explicitly distinguish ‘he’, ‘she’, and ‘it’.

A feature that also got lost is the assignment of thematic vowels in personal pronouns to third-person referents: originally, every third-person referent newly introduced into discourse would be assigned one of /a e i o u/ to disambiguate, and there was even a morpheme to mark that the speaker wanted to dissolve the association. Constituent order was theoretically variable at first, but I preferred SVO/AVP due to familiarity with that. Later on, however, I settled on VSO/VAP. Also, I had no idea about what was called “trigger morphology” on *Conlang-L* for the longest time—essentially, this referred to the Austronesian, or Philippine, alignment. I am not claiming that I know all about it now, just that due to reading up on the topic, I have a slightly more informed understanding now. Orthography changed as well over the years, so ⟨c⟩ in the early examples encodes the /k/ sound, not /tʃ/ as it does today; diphthongs were spelled as ⟨Vi⟩ instead of modern ⟨Vy⟩.

What was definitely beneficial for the development of Ayeri was the ever increasing amount of linguistics materials available online and my entering university (to

study literature) in 2009, where I learned how to do research and also had a lot of interesting books available at the library.

One of the things people regularly compliment me on is Ayeri's script—note, however, that Tahano Hikamu was not the first one I came up with for Ayeri. Apparently, I had already been fascinated with the look of Javanese/Balinese writing early on;² Figure 0.1 shows a draft dated February 9, 2004. However, the letter shapes in this draft looked so confusingly alike that I could never memorize them. About a year later, I came up with the draft in Figure 0.2. What is titled “Another Experimental Script” there is what would later turn into Tahano Hikamu, Ayeri's ‘native’ script. According to the notes in my fictional language ring binder, the script looked much the same as today about a year from then, but things have only been mostly stable since about 2008.

An important date in the history of Ayeri was when I decided to set up an improved website for Ayeri that would include a blog. The idea was that this way, I could more freely write on whatever detail I currently interested me in Ayeri, outside of the constraints of the Grammar. Thus, *Benung. The Ayeri Language Resource* launched on March 1, 2011. Being able to write short articles, however, probably also led to neglecting work on the actual formal reference grammar, which had been lying dormant from January 2011 on. This was always on the premise that I would eventually include the information from blog articles in the grammar. However, juggling such a big document had always felt daunting, so I let laziness take the better part of me eventually as enthusiasm gradually subsided.³ This renewed attempt at documentation has been started with the intention to right those wrongs.

I hope that by now it should be clear which kind of a fictional language Ayeri is: a personal, artistic language—or *artlang* in community parlance. Thus, my goal in creating Ayeri is not to propose yet another international auxiliary language, like Esperanto. It is also not my goal to make it as logical as possible, like Lojban. Neither is it my goal to engineer it towards certain underlying premises, for example, to reach a maximal amount of information density, like Ithkuil, or to get by on as few different words as possible, like Toki Pona. It is also not a ‘what-if’ language in the sense of “What could the modern language of Old Irish speakers transplanted to Australia look like?” or “Latin piped through Athabascan sound changes.”

Ayeri is rather an attempt to create an artificial language for personal enjoyment and intellectual stimulation by creating a feedback loop between reading up on

² Compare, for instance, the charts in Kuipers and McDermott (1996). The Wikipedia articles on either script contain a number of images depicting the scripts in use, both current and historic.

³ Let me add to my defense, however, that I also worked on my B.A. thesis in 2013 and my M.A. thesis in 2016, which required several months of preparation each and thus left me largely unable to work much on Ayeri.

Figure 0.1: First design for an Ayeri script (February 9, 2004)

linguistics and actively devising rules for a fictional language accordingly, to see how things work within the frame I created, or to try and see whether certain ideas work together at all when combined, and to better understand why they do or do not. Ayeri will only ever be as perfect as miniature models of things can be, since it has not grown organically from millenia of human interaction, and I cannot and will never know about each and every aspect of language myself, in spite of continued curiosity about these matters. Nor will it be possible for me to replicate all the fascinating twists and irregularities that natural languages normally entail. The ultimate goal in my work on Ayeri is, I suppose, to make it emulate natural languages to at least some degree of depth and complexity.

In writing this grammar, I hope that I will find a good balance between applying linguistic theory to already existing materials and ideas, and going forth to create rules for aspects of the language that have so far been neglected, often due to my

Figure 0.2: First draft for Tahano Hikamu (March 23, 2005)

not being aware of them. In my opinion, the split between being able to apply methods of linguistics to what has grown over the course of more than a decade on the one hand, and discovering and developing new aspects of the language on the other is what makes Ayer an interesting piece of “informed nonsense,” as a colleague of mine once put it.

Errors are all mine. If my English is not always fully idiomatic, you find that I got my terminology wrong, or not all aspects of the language or its description are equally well worked-out—which are all very likely events—I ask you to bear with me. For one, English is not my native language, and second, I put up the grammar on GitHub in the hope of making it easier to fix and extend things through patches.⁴ This also means that you can file an Issue there in case of issues if you feel inclined to do so. Criticism is always welcome as long as it is constructive.

⁴ See <https://github.com/carbeck/ayerigrammar/>.

1 Phonology

This chapter will present charts depicting the phoneme inventory of Ayeri and describe the various commonly encountered allophones of both consonants and vowels. Following this, a detailed statistical analysis of the words found in a number of translated texts from 2008 to 2016 as well as dictionary entries up to July 2016 will produce insights into Ayeri’s phonotactics. Some notes on stress patterns and intonation will close the chapter.

1.1 Phoneme inventory

1.1.1 Consonants

At 17 consonants, Ayeri has a “moderately small” inventory, according to Maddieson (2013a). Figure 1.1 shows the full chart of consonant phonemes.

Regarding allophony, /tj kj/ and /dj gj/ are usually realized as [tʃ] and [dʒ], respectively, except if a homorganic nasal /n/ or /ŋ/ is preceding: for instance, ႳႵႫႰ *ankyū* /ʼaŋkju/ ‘really’ is realized as [ʼaŋkju], not as *[ʼaŋtʃu] or *[ʼantʃu]. It is important to note, however, that besides this synchronic palatalization process leading to [tʃ] and [dʒ] as *allophones*, there is also a diachronic one in parallel here—or the diachronic process is still ongoing. For example, there is no way to predict whether ႳႵႫ *cuna* ‘original, initial’, ႳႵႫ *panca* ‘finally, eventually’, and ႳႵႫ *vac-* ‘like’, or ႳႵႫ *jaraṇ* ‘pilgrimage’, ႳႵႫ *aja-* ‘play’, and ႳႵႫ *nui-* ‘pour’ have /tj/ or /kj/, /dj/ or /gj/, respectively, unless we consider the clues given by the conservative native spellings of the respective words.¹ We can rather assume two sound changes, (1) tj, kj → tʃ, and (2) dj, gj → dʒ, leading to the *phonemes* /tʃ/ and /dʒ/ in the present-day language.

¹ Actual scribes would typically err in cases where the merger is complete, so this strategy would, in fact, be of limited use in the real world.

Figure 1.1: Consonant inventory (divergent orthography in pointed brackets>)

	Bilabials		Labiodentals		Alveolars		Palatals		Velars		Glottals	
Plosives	p	b			t	d			k	g		
Affricates					tʃ <c>	dʒ <j>						
Nasals		m				n				ŋ <ng>		
Fricatives			v		s						h	
Taps/Flaps						r						
Approximants					l		j <y>					

The plural marker Ⴄ *-ye* is commonly contracted to $[\text{dʒ}]$ when a case suffix beginning with a vowel follows:²

- (1) a. ႤႬႬႬႬႬ *nyānyeang* → *nyānjang* $[\text{'nja:ndʒaŋ}]$ ‘persons’ (person-PL-A);
 b. ႬႬႬႬႬ *netuyas* → *netujas* $[\text{ne'tudʒas}]$ ‘brothers’ (brother-PL-P).

The plural marker may also contract before the locative marker Ⴌ *-ya* and the dative marker ႬႬ *-yam*, basically for dissimilation:³

- (2) a. ႬႬႬႬႬ *nivayeya* → *nivajya* $[\text{ni'vadʒja}]$ ‘at the eyes’ (eye-PL-LOC);
 b. ႬႬႬႬႬႬႬ *maviyeyam* → *mavijyam* $[\text{ma'vidʒjam}]$ ‘to the sheep’ (sheep-PL-DAT).

Dissimilation of the sequence ႬႬ *-yaya* is attested in my translation of Kafka’s short story “Eine kaiserliche Botschaft,” where the relative pronoun ႬႬႬ *siyaya* appears transcribed as *sijya*:

As far as morphophonology is concerned, the relative pronoun complex *sijya* ‘in/at/on which.LOC’ is interesting in so far as it is a contraction of **siyaya* ‘REL-LOC-LOC’ that I introduced here [...] Since this feature does not occur in previous texts, let’s assume it’s an acceptable variant. (Becker 2012: 12)

The contraction happens “only if both parts are grammatical suffixes” (12), however, so the environments this contraction may appear in are effectively limited to relative pronouns combining locative and locative, or locative and dative marking.

The word ႬႬႬႬႬ *lajāy* ‘student’ is special in that it is the only word with Ⴌ $[\text{dʒa}]$ so far. Presumably it is derived from the verb ႬႬႬ *laya-* ‘read’ with the agentive suffix ႬႬႬ *-maya*, except the shortening of the suffix—with or without compensatory lengthening of the final vowel of the modified word stem—was applied irregularly, possibly via **ႬႬႬႬႬ* **layāya*. The regular form ႬႬႬႬႬႬႬ *layamaya* means ‘reader’.

Lastly, $/h/$ may assimilate to its phonemic environment and is realized as $[\text{ç}]$ before front vowels, and as $[\text{x}]$ before back vowels in this case:

- (3) a. ႬႬႬ *tabi* $[\text{'taçi}]$ ‘favorable’;
 b. ႬႬႬ *babo* $[\text{'baxo}]$ ‘loud’.

While vowels become long when two identical vowels come into succession, consonants do not geminate but are treated like a single consonant:

² The customary romanization uses $\langle c \rangle$ and $\langle j \rangle$ for allophonic cases of $[\text{tʃ}]$ and $[\text{dʒ}]$ as well.

³ ႬႬ *-ea* also occurs as an allomorph, so that Ⴄ *-ye* + ႬႬ *-ea* → ႬႬႬ *-yēa*.

- (4) a. ᲛᲟᲠᲚᲗ *tavvāng* [ta'va:ŋ] 'you get' (get=2SG.A),
 b. ᲚᲚᲠᲚᲗ *disyyang* [di'sjaŋ] 'I fasten' (fasten=1SG.A).

With diphthongs, the sequence /Vɪ.j/ is treated as though it were /Vj.j/, so the double /j/ simplifies to just a single /j/; however, the vowel remains lax in spite of being phonetically in an open position now:

- (5) ᲛᲚᲠᲚᲗ *tipuyya* [ti'pu.ja] 'on the grass' (grass-LOC).

1.1.2 Vowels

Figure 1.2: Vowel inventory (divergent orthography in pointed brackets)

	Front	Center	Back
High	i, i: ⟨ī⟩		u, u: ⟨ū⟩
Mid	e, e: ⟨ē⟩	ə ⟨ə, e⟩	o, o: ⟨ō⟩
Back		a, a: ⟨ā⟩	

Ayeri's vowel system distinguishes five qualities, as shown in Figure 1.2; Maddieson (2013c) classifies this as "average." Length, however, is also a factor, and there are five diphthongs as well, as we will see below. At $\frac{17}{5}$, the consonant–vowel ratio is 4.25, which Maddieson (2013b) again classifies as "average," although Ayeri finds itself at the upper end of the tier.

The lax vowels [ɪ ɛ ɔ ʊ] occur as allophones of their tense counterparts /i e o u/ in closed syllables, for example:

- (6) a. ᲛᲚᲗ *ming* [mɪŋ] 'can, be able',
 b. ᲛᲚᲗ *enya* [ɛn.ja] 'everyone',
 c. ᲛᲚᲗ *agon* [a.gɔn] 'outer, foreign', and
 d. ᲛᲚᲗ *pakur* [pa.kʊr] 'ill, sick'.

/ə/ occurs marginally in the tense prefixes ᲛᲚᲗ *kə*- 'NPST', ᲛᲚᲗ *mə*- 'PST', ᲛᲚᲗ *və*- 'RPST', as well as in the prefix ᲛᲚᲗ *mə*- 'some, whichever'. Otherwise, [ə] acts as an allophone of /e/ in final unstressed position, for instance, in the word ᲛᲚᲗ *mine* [ˈmɪnə] 'affair, matter, issue'.

Ayeri also possesses a number of diphthongs, these are: /aɪ eɪ ɔɪ uɪ au/, spelled ⟨ay⟩, ⟨ey⟩, ⟨oy⟩, ⟨uy⟩, and ⟨au⟩. Furthermore, there are long equivalents of the short vowels: /i: e: a: o: u:/; in romanization, long vowels are marked with a macron ⟨̄⟩ over the letter. Long vowels are lexicalized in a few words, for example:

- (7) a. ᠨᠢᠰᠠ *nīsa* ‘wanted’, ᠫᠤᠰᠢᠰᠠ *pasīsa* ‘interesting’;
 b. ᠠᠷᠡᠨ *arēn* ‘anyway, however’, ᠯᠡᠷᠠ *lēra* ‘whore’;
 c. ᠯᠠ *lā* ‘tongue’, ᠶᠠᠩ *yāng* ‘he’ (he.A);
 d. ᠨᠣᠨ *nōn* ‘will, intention’; and
 e. ᠪᠠᠪᠤᠠᠨ *babūan* ‘barbarian’.⁴

Otherwise, long vowels result from two same vowels next to each other, for instance:

- (8) ᠠᠵᠠ *aja-* ‘play’ + ᠠᠨ *-an* ‘NMLZ’ \rightarrow ᠠᠵᠠᠨ *ajān* ‘game, play’.

Morphophonologically, long vowels also occur in double-marked relative pronouns where the agreement marker for the relative clause’s head has been omitted, for instance, ᠰᠢᠨᠠ *sinā* ‘of which, about which’, as in the following example:

- (9) *Le turayāng taman sinā ang ningay tamala vās.*
Le tura-yāng [taman-Ø]₁ si-Ø₁-na ang ning=ay.Ø tamala vās
 PT.INAN send=3SG.M.A letter-TOP REL-PT.INAN-GEN AT tell=1SG.TOP yesterday 2SG.P
 ‘The letter which I told you about yesterday, he sent it.’

This is to disambiguate it from the plain genitive-marked relative pronoun ᠰᠢᠨᠠ *sina* ‘which.GEN’:⁵

- (10) *tamanreng ledanena nā sina koronvāng*
taman-reng [ledan-ena nā]₁ si-na₁ koron-vāng
 letter-A.INAN friend-GEN 1SG.GEN REL-GEN know=2SG.A
 ‘the letter of my friend which you know’

As pointed out in (7c), the word ᠯᠠ *lā* ‘tongue’ ends in a long vowel, so the question is what happens when a case suffix beginning with a vowel is appended. To avoid a hiatus, a glide /j/ may be inserted, so both of the following renditions are possible:

⁴ I have gone years without /u:/, but it has always seemed slightly odd to me to lack a vowel in that position when all other vowels can be long. Therefore, ᠪᠠᠪᠤᠠᠨ *babūan* ‘barbarian’ and its adjective ᠪᠠᠪᠤ *babū* ‘barbarian (adj.)’ were coined as ᠫᠠᠩᠭᠠᠢᠶᠡ *prankayē*—things ‘that you put in specifically to make things fit’, another new coining this decision resulted in.

⁵ A variant which combines the allomorphs of the relativizer and the genitive case marker in the opposite way also exists: ᠰᠢ *s-* + ᠠᠨᠠ *-ena* \rightarrow ᠰᠢᠨᠠ *sena*.

- (11) a. *Aku* *lāas!*
 Aka-u *lā-as*
 swallow-IMP tongue-P
 ‘Shut up!’
 b. *Aku lāyas!*
 (idem)

With diphthongs—as described above—, /ɪ/ coalesces with a following /j/ to /j/, but the initial vowel will not become tense, thus:

- (12) *ṣṣṣṣṣṣ tipuyya* [ti'pɯ.ja] ‘on the grass’ (grass-LOC).

Moreover, /u/ is commonly realized as [w] when followed by a vowel, for example in *ṣṣṣṣṣṣ huākaya* ['wa:kaja] ‘frog’ or *ṣṣṣṣṣṣ rua-* [rwa] ‘have to, must’. [w] may also be an allophone of /uj/, as in *ṣṣṣṣṣṣ adauyi* [a'dawi] ‘then’, *ṣṣṣṣṣṣ edauyi* [e'dawi] ‘now’, or *ṣṣṣṣṣṣ nekuyi* ['nekwi] ‘eyebrows’. The negative suffix *-oy* is also commonly contracted to [w] before a diphthong:

- (13) *ṣṣṣṣṣṣ mingoyay* → *minguay* [mɪŋ'wai] ‘I cannot’ (can-NEG=ISG.TOP).

1.2 Phonotactics

For the purpose of this statistical analysis, most of the available translations into Ayeri from late 2008 to July 2016 have been used as a text corpus;⁶ example sentences from various blog articles have also been added, as well as dictionary entries for all nouns, adjectives, adverbs, pronouns, adpositions, conjunctions, and numerals if they were not prefixes or suffixes.⁷ Borrowings have been deleted if they could not reasonably be words in Ayeri. Altogether, the corpus comprises 5,500 words, which

⁶ These texts are: A Medieval Neighborhood Dispute (2015), A Message from the Emperor (2012), Article 1 of the Universal Declaration of Human Rights (2011), The Beginning of Tolstoy’s *Anna Karenina* (2014), Conlang Christmas Card Exchange 2008/09 (2009), Conlang Holiday Card Exchange 2010/11 (2011), Conlang Relay 15 (2008), Conlang Relay 17 (2010), Conlang Relay 18 (2011), The First Two Chapters from Saint-Exupéry’s *Le Petit Prince* (2013), The Four Candles (2010), Honey Everlasting (2014), LCC4 Relay (2011), The Lord’s Prayer (2015), The North Wind and the Sun (2016), The Origin of the Wind (2009), Ozymandias (2011), Please Call Stella ... (2008), Psalm 23 (2013), The Scientific Method (2014), The Sheep and the Horses (2012), Sugar Fairies (2011), The Upside-Down Ice Skater (2009). The texts can be accessed from Becker (2016: Examples).

⁷ This section updates and extends a previous analysis of the phonological makeup of dictionary entries (Becker 2010). The previous study had its focus on gathering frequency statistics for word generation, however, we want to know about words generally here.

is a very small figure for such a study, but there are only so many texts available unfortunately. Words may occur more than once.

Among the dictionary entries, verbs have notably been ignored, since verb stems alone do not constitute independent words—they are always inflected in some way, so that they may end in consonants or consonant clusters that independent words cannot end in. This also has repercussions on syllabification and stress, which depend on the inflection of the verb stem:

Figure 1.3: Syllabification of inflected verbs

Suffix	<i>ca-</i> ‘love’	<i>gum-</i> ‘work’	<i>babr-</i> ‘mumble’
- <i>ay</i> (1SG)	cá.y	gu.máy	ba.bráy
- <i>va</i> (2SG)	cá.va	gúm.va	ba.brá.va
- <i>yam</i> (PTCP)	cá.yam	gúm.yam	bá.bryam

For the purpose of gathering statistics on phonemes, the words from translated texts were converted to IPA first. Fortunately, this is rather easy as Ayer’s romanization is very straightforward. Syllable breaks have also been inserted semi-automatically.

1.2.1 Number of syllables per word

First, let us see how many syllables words commonly have (see Table 1.1). The higher the syllable count, the more likely it is for them to be compounds or inflected words.

Table 1.1: Frequency of words with different numbers of syllables (n = 5500)

Segment	Count	Percentage
2 syllables	2277	41.40%
3 syllables	1393	25.33%
1 syllable	1201	21.84%
4 syllables	547	9.95%
5 syllables	74	1.35%
6 syllables	8	0.15%

Two-syllable words make up the bulk of the sample, which is not surprising since 1,072 entries (55.43%) in the dictionary subsample are disyllabic: most of Ayer’s roots are disyllabic. Unsurprisingly, most monosyllabic words are function words like the ones cited below. In the following, I will quote a few examples for each number of syllables per word:

- (14) a. ၼာ *ang* (AT),
 န *nay* ‘and’,
 ရ *rua* ‘must’;
 b. ပါ *datau* ‘normal’,
 အန *nasay* ‘near to’;
 c. ၼ်း *avanyāng* ‘he sinks’ (sink=3SG.M.A),
 တ *tovalay* ‘a cloak’ (cloak-P.INAN);
 d. ပုံ *binyanveno* (corner.beautiful, a place name),
 မိ *mitanena* ‘of the palace’ (palace-GEN);
 e. ဃ *haruyamanas* ‘a beating’ (beat-PTCP-NMLZ-P),
 နီ *sungkorankibas* ‘geography’ (science.map);
 f. နီ *kaytomayanena* ‘of righteousness’ (righteous-NMLZ-GEN),
 နီ *nasimayajang-ben* ‘all followers’ (follow-AGTZ-PL-A=all).

Table 1.2 shows the frequencies of syllable types by position in a word. It is important to note here that phonemes which consist of more than one segment—affricates, diphthongs, and long vowels—have been counted as only one of C (consonant) or V (vowel), respectively. The following subsections will elaborate on which sounds the Cs and Vs correspond to. Moreover, it is important to note that medial syllables have not been further distinguished by position in the word for the sake of this analysis, so anything between the second and the fifth medial syllable is treated the same. It would furthermore be possible to calculate the frequencies of one syllable type following the other, however, no such calculations have been carried out here.

In all positions, CV is the most common syllable type, followed by CVC. With a very big margin, V is the next most common syllable type, which is also most common in initial syllables and least common in monosyllabic words. The cases with only a few attestations are the following:

- (15) a. Initial CVCC:
 လ် *linktang* /lɪŋk.ˈtaŋ/ ‘they try’ (try=3PL.M.A),⁸
 လ် *silvnang* /silv.ˈnaŋ/ ‘we see’ (see=IPL.A);
 b. Final CCCV:
 မိ *migr̥yo* /ˈmi.gr̥jo/ ‘flourishes’ (flourish-3SG.N),
 နီ *subr̥yo* /ˈsu.br̥jo/ ‘ceases’ (cease-3SG.N);
 c. Single V:
 အီ *ay* /aɪ/ ‘I’ (1SG.TOP).

The medial and final VC cases may seem like an oddity, but they are mostly due

⁸ The verb stem is found in the dictionary as လ် *linka-*, with a final *-a*, and thus is possibly an entry changed at a later point, or the example from the text (Sugar Fairies) chosen here contains an error.

Table 1.2: Frequency of syllable types per word (n = 5500)

Type	Initial	Medial	Final	Single	Total
CV	2896	1974	2109	578	7557
CCV	55	24	46	32	157
CCCV	—	—	2	—	2
CVC	761	610	1902	298	3571
CCVC	29	10	85	9	133
CVCC	2	—	—	—	2
V	488	95	67	2	652
VC	68	28	88	282	466
Total	4299	2741	4299	1201	12540
	100.00%	100.00%	100.00%	100.00%	100.00%

to the previous syllable ending in /ŋ/, with that syllable also containing a lax vowel, which means that this syllable must be closed. An alternative explanation would be to assume that /ŋ/ is ambisyllabic, or actually /n.g ~ ŋ.g/, but realized as [ŋ]. The high number of single-syllable VC is due to *ᐱᑦ ang* 'AT', which alone appears 255 times in the sample (4.63% of all words, 21.23% of monosyllabic words, 90.43% of monosyllabic VC words).

1.2.2 Phonemic makeup of initial syllables

The statistics in the following sections have been gathered from the IPA conversions of translated texts and dictionary entries mentioned above. The transcribed words have been split into syllables and then the collected contents of each position group were written into separate plain text files, one each for:

- all initial syllables of polysyllabic words,
- all medial syllables of polysyllabic words,
- all final syllables of polysyllabic words, and
- all monosyllabic words.

Monosyllabic words are both initial and final syllables at the same time; they have been counted separately for the purpose of this analysis. Onsets, nuclei and codas have been matched by regular expressions; the command line tools *grep*, *sort*, and *uniq* were used to aggregate all occurring variants for each syllable segment as well as their absolute frequencies:⁹

```
(16) C = (? : t f | d ʒ | [ptkbgdmnŋvshrɭjw])
      V = (? : [ae] : ? ɪ | əʊ | [ieaou] : ? | [ɪɛʊə])
```

As we have seen above (Table 1.2), CCV syllables only make up 1.28% of initial syllables, insofar it is no surprise that consonant clusters all appear at the bottom of Table 1.3. There also seem to be combination patterns in that initial clusters exist for all plosives plus /r/, and almost all bilabials plus /j/, with the exception of /bj/, however, /nj/ is added to the group instead. Combinations with /w/ only occur for /b/, /r/, and /s/, which do not share an obvious connection. Syllables without a consonant filling the onset position are marked with 'Ø'; these numbers correspond to the VC and VCC rows in Table 1.2.

Perhaps most striking about the nuclei of initial syllables presented in Table 1.4 is that plain vowels occur most frequently. As mentioned above, lax vowels are counted here as allophones of tense ones as their distribution is complementary and

⁹ However, *sort* was unable to handle all IPA characters, so *sed 'y/ɛɪʊə:fʒŋ/EIŌU@:SZN/'* had to be used to compensate by transcribing everything into X-SAMPA.

Table 1.3: Frequency of onsets in initial syllables (n = 4299)

Phoneme	Frequency	Percentage
Ø	556	12.93 %
s	488	11.35 %
t	432	10.05 %
m	418	9.72 %
k	380	8.84 %
n	375	8.72 %
p	334	7.77 %
b	231	5.37 %
d	172	4.00 %
v	164	3.81 %
l	159	3.70 %

j	126	2.93 %
g	111	2.58 %
h	99	2.30 %
tʃ	30	0.70 %
pr	27	0.63 %
nj	27	0.63 %
kr	8	0.19 %
br	8	0.19 %
tr	6	0.14 %
dʒ	4	0.09 %
gr	3	0.07 %
w	2	0.05 %
sw	1	0.02 %
rw	1	0.02 %
pj	1	0.02 %
mj	1	0.02 %
bw	1	0.02 %

Table 1.4: Frequency of nuclei in initial syllables (n = 4299)

Phoneme	Frequency	Percentage
a	1847	42.96 %
i	1011	23.52 %
<i>i</i>	802	18.66 %
<i>ɪ</i>	209	4.86 %
e	705	16.40 %
<i>e</i>	523	12.17 %
<i>ɛ</i>	164	3.81 %
<i>ə</i>	18	0.42 %
u	260	6.05 %
<i>u</i>	228	5.30 %
<i>ʊ</i>	32	0.74 %
o	227	5.28 %
<i>o</i>	188	4.37 %
<i>ɔ</i>	39	0.91 %
a:	109	2.54 %
aɪ	88	2.05 %
eɪ	40	0.93 %
e:	4	0.09 %
ɔɪ	3	0.07 %
ʊɪ	1	0.02 %
o:	1	0.02 %
i:	1	0.02 %
e:ɪ	1	0.02 %
aʊ	1	0.02 %

are listed here for the sake of completeness. This is the reason why the plain vowels are presented as grouped with their allophones in this table as well as in subsequent ones. Long vowels and diphthongs find themselves below the 5% threshold, and the words with single occurrences are:

- (17) a. ၵ၆ၵ၆ၵ၆ *kuysān* ‘comparison’,
 b. ၵ၆ၵ၆ *nōn* ‘will, intention’,
 c. ၵ၆ၵ၆ *nīsa* ‘wanted’,¹⁰
 d. ၵ၆ၵ၆ၵ၆ၵ၆ *sēyaya* ‘will overcome’ (FUT-overcome-3SG.M),
 e. ၵ၆ၵ၆ *sautan* ‘cork’.

As the diphthong [e:i] only occurs due to allophony, it should not be counted as a phoneme for the purposes of this analysis. On the other hand, the same could be said for a lot of cases of [a:] included here—this caveat applies to all nouns derived from verbs ending in *-a* with the very common nominalizing suffix ၵ၆ၵ၆ *-an*, as exemplified in (8) above. Similarly, the 18 instances of /ə/ reported here are mostly from tense prefixes also mentioned above, for instance, ၵ၆ၵ၆ၵ၆ၵ၆ *məkoronay* ‘I knew’ (PST-know=1SG.TOP).

Table 1.5: Frequency of codas in initial syllables (n = 4299)

Phoneme	Frequency	Percentage
Ø	3441	80.04 %
n	298	6.93 %
ŋ	243	5.65 %
r	129	3.00 %
l	88	2.05 %
m	74	1.72 %
s	20	0.47 %
t	2	0.05 %
h	2	0.05 %
tʃ	1	0.02 %
ŋk	1	0.02 %
lv	1	0.02 %
k	1	0.02 %

Initial-syllable codas (Table 1.5) are far less diverse than consonant onsets: there are only 10 attested segments in comparison to 28 for onsets (not counting empty

¹⁰ ၵ၆ၵ၆ *nīsa* and ၵ၆ၵ၆ *nōn* are both related to ၵ၆ၵ၆ *no-* ‘want, plan’.

codas of C(C)V syllables, which constitute the majority by a large margin), and the only two cluster attested are /ŋk/ in the word linktang ‘they try’ (try=3PL.M.A), and /lv/ in the word silvnang ‘I see’ (see=IPL.A). There only being two incidences of a CC cluster is very probably an effect of the small sample size. Furthermore, the only unvoiced single coda consonants attested are /s/, /h/, /t/, /tʃ/ and /k/, the latter two only once, /h/ twice:

- (18) a. mehvāng ‘you are supposed to’ (be.supposed.to=2SG.A),¹¹
 rohtang ‘they bite’ (bite=3SG.M.A);
 b. mutva ‘you rub’ (rub=2SG.TOP),
 patlay ‘cousin’;
 c. sik-sik ‘tits’;
 d. vacvāng ‘you like’ (like=2SG.A).

1.2.3 Phonemic makeup of medial syllables

The onsets of medial syllables (Table 1.6) show properties very similar to those of initial syllables. The order of most common consonants may differ here—for example, the most common onset is /r/, not Ø or /s/—, but there are no restrictions on consonants to appear in this position, with the exception of /ŋ/ for reasons stated above (see section 1.2.1). Regarding initial clusters, there are further attestations for plosive plus /r/ (except for /kr/). As for clusters with /j/, the only one with a bilabial is /bj/, but the set is extended to /sj/ and /kj/. For clusters with /w/, only /sw/ and /kw/ occur here, while attestations for /bw/ and /rw/ as in initial-syllable onsets are lacking. This does not mean that those combinations are not principally possible in this position, however.

As with onset consonants, vowel nuclei of medial syllables (Table 1.7) do not show significant differences compared to those of initial syllables either. /a/ is more common here, and /o/ and /u/ switch places. Instead of /e:i/, there is an attestation of /u:/ (see footnote 4), for which there is more reason to be counted as a phoneme than for /e:i/. The sequences /i:/ and /u:/ also only occur once and twice, respectively, namely in the following words:

- (19) a. pasisa ‘interesting’;
 b. puluyley ‘a mirror’ (mirror-P.INAN),
 tipuyya ‘on the grass’ (grass-LOC).

¹¹ The dictionary entry for the verb is mya- , so this may be an instance of my changing a word in the dictionary with the old one staying in the text (The Four Candles).

Table 1.6: Frequency of onsets in medial syllables (n = 2741)

Phoneme	Frequency	Percentage
Ø	123	4.49%

The word in (19a), པའི་ཤིང་ *paśiṅ* ‘interesting’, is rather transparently constitutes a causative derivation of the verb པར་ཤིང་ *pasy-* ‘wonder, be curious, be interested’, essentially meaning ‘making one wonder/curious’—the causative suffix -ཤིང་ *-iṅ* can as well be used to derive adjectives with a causative or resultative meaning. Nonetheless it should count as a lexeme in its own right, since it possesses idiomatic meaning.

With medial-syllable codas (Table 1.8) again, sonorants and /s/ make up the largest number of consonants in this position; /t/ and /g/ only occur once each in

- (20) a. ᐃᓂᑦᔪᓴᓂᓄᑦ *pangitlan* ‘money change’,¹²and
 b. ᐅᓴᓂᑦᔪᓴᓂᓄᑦ *telugtong* ‘they survive’ (survive=3PL.N).

Phoneme	Frequency	Percentage

s	32	1.17 %
l	21	0.77 %
t	1	0.04 %
g	1	0.04 %

¹³ The sequence /sj/ poses difficulty here as there are examples for /Vs.jV/ as well as for /V.sjV/, and I cannot tell for sure if there is a strict rule in operation. It seems that /V.sjV/ is more likely to occur when the second syllable is stressed, whereas /Vs.jV/ is more likely to occur when the first syllable is stressed. Ayer's own Tahano Hikamu orthography would not show the

Table 1.9: Frequency of onsets in final syllables (n = 4299)

w	9	0.21%			

Nuclei of final syllables (Table 1.10) do not bear striking differences to nuclei in other positions. /a:/ comes out second here due to the common nominalizer *-an*, which lengthens the vowel of verb stems ending in /a/, as demonstrated in (8). /aɪ/ is also fairly common here as it is the topic-marked first-person pronoun/pronominal clitic; for the same reason, /a:ɪ/ occurs a number of times—the vowel-lengthening rule applies here as well, so its status as a phoneme is marginal. All instances of /e:/ in the sample are from the word *arēn* ‘anyway, however’; all evidence for /i:/ is from *sirī* ‘due to which’ (see section 1.1.2). The only evidence for /u:/ in the sample is from *babū* ‘barbarian (adj.)’.

The list of coda consonants in final syllables (Table 1.11) is very slightly more

difference either, since /sja/ is spelled *ḡ* either way, and there is no heeding morpheme breaks in placing the diacritic. /CsjV/ will be /C.sjV/ in any case, since Ayeri avoids final consonant clusters if possible, see Table 1.2.

Table 1.10: Frequency of nuclei in final syllables (n = 4299)

Phoneme	Frequency	Percentage

restrictive than even that of coda consonants in medial syllables (see Table 1.8), since the only non-sonorant attested is /k/, which only occurs in *ṣik-ṣik* ‘tits’ again, which—besides being a vulgar term, thus maybe slightly more dispositioned to allow for deviating phonotactics—looks quite like onomatopoeia, possibly for the sound of sucking.¹⁴

1.2.5 Phonemic makeup of single syllables

Onsets of single syllables (Table 1.12) appear to be the least varied category. Still, none of the basic set of consonant morphemes (see Figure 1.1) is missing—the frequency order is just completely different from the other onsets surveyed, not merely a mix of initial and final syllables. Consonant clusters with /j/, /w/ and /r/ exist here as well. Combinations with /j/ are only present for /m/ and /n/, while /r/ again combines with plosives; /w/ combines with /n/ and /r/ at least, which we have already seen in final-syllable onsets (see Table 1.9). Whereas /mj/ has only occurred once in initial-syllable onsets so far (see Table 1.3), it occurs a few more times here, all in the word *ṣṣ mya* ‘be supposed to’, which is very commonly used as an unconjugatable modal particle.

A consonant onset that can only be found in monosyllables is /ŋ/,¹⁵ in *ṣṣ -ngas* ‘almost’, a quantifier suffix that has managed to sneak in due to being marked as an adverb in the dictionary, since it can modify a verb:

¹⁴ Kroonen (2013: 489–490) identifies PGmc **sūgan-*, **sūkan-* ‘to suck’ as an iterative of PGmc **sukkōn-*, **sugōn-* ‘to suck’ and reconstructs PIE **souk-neh₂-*. However, he does not say anything about the Germanic word being onomatopoeic in origin.

¹⁵ At least according to the analysis chosen here, see section 1.2.1 for an explanation.

Table 1.12: Frequency of onsets in single syllables (n = 1201)

kr	1	0.08%
br	1	0.08%

- (21) *Apayeng-ngas.*
 Apa-yeng-ngas
 laugh=3SG.F.A=almost
 ‘She almost laughed.’

Here, ၵာၵ -*ngas* modifies the verb complex like any other adverb:

- (22) *Apayeng babo.*
 Apa-yeng baho
 laugh=3SG.F.A loudly
 ‘She laughs loudly.’

However, whereas ၵာၵ *babo* ‘loud’ is treated as a separate unit in terms of intonation, ၵာၵ -*ngas* is unstressed and binds to what it follows:

- (23) a. ၵာၵ ၵာၵ ၵာၵ *Apayeng-ngas*. [apa'jɛŋas];
 b. ၵာၵ ၵာၵ ၵာၵ *Apayeng babo*. [apa'jɛŋ 'baxo].

As with onset consonants of monosyllabic words, nuclei of this syllable type are the least diverse group again (Table 1.13). One segment that is notably absent is /au/, and the marginally phonemic /e:/ is not present either. By having /a/, /aɪ/, /a:/ at the top, monosyllabic words behave similar to final syllables of polysyllabic words (see Table 1.10), however, the order of the most common vowels bears more similarities to that of initial and medial syllables (see Tables 1.4 and 1.7). The very uncommon /o:/ features twice in this group, namely in two instances of the word ၵာၵ *nōn* ‘will, intention’.¹⁶

Like the other syllable segments of monosyllabic words, coda consonants (Table 1.14) as well show the lowest degree of variety among all the coda consonants of the various syllable classes discussed so far. The order is basically the same as that of final-syllable codas (see Table 1.11), though /ŋ/ supersedes /n/ and there is some attestation of final /h/. As noted above, the prevalence of /ŋ/ is due to the agent-topic marker ၵာၵ *ang* (see section 1.2.1). /h/ only occurs in the interjections ၵာၵ *ah!* and ၵာၵ *āh!*, so its status as an actual phoneme in this position is marginal at best.

1.2.6 Cross-syllable consonant clusters

Since a table detailing every combination with its absolute and relative frequency would be too large here, Table 1.15 gives the attested combinations ordered by brack-

¹⁶ Ayeri used to have ၵာၵ -*on* as a nominalizer beside ၵာၵ -*an*, however, it was not very productive and has long fallen out of use. ၵာၵ *nōn* is thus, in fact, originally a nominalization of ၵာၵ *no*- ‘want, plan’.

Table 1.13: Frequency of nuclei in single syllables (n = 1201)

Phoneme	Frequency	Percentage
a	568	47.29%
aɪ	171	14.24%

n	105	8.74%
s	58	4.83%
m	36	3.00%
l	6	0.50%
h	4	0.33%
r	3	0.25%

Table 1.15: Frequency of cross-syllable consonant clusters (n = 1270)

Interval [%]	Consonant cluster
0.00 ... 0.09	g.t, h.t, h.v, k.s, l.n, lv.n, m.bj, m.d, m.dʒ, m.l, m.n, m.pr, m.r, n.dv, n.g, n.h, n.w, ŋ.dʒj, ŋ.kw, ŋ.m, ŋ.n, ŋ.rj, ŋ.t, ŋk.t, r.b, r.dʒ, r.g, r.l, r.m, r.sj, r.tʃ, r.v, s.dʒ, s.h, s.l, s.n, s.p, s.v, t.v, tʃ.v (0.08%).
0.10 ... 0.24	l.bj, m.br, m.t, n.s, ŋ.b, ŋ.h, ŋ.p, ŋ.w, r.dʒj, r.pj, s.dʒj, s.m, t.l (0.16%); l.dʒ, l.p, m.k, n.sj, ŋ.dʒ, ŋ.g, ŋ.s, r.pr (0.24%).
0.25 ... 0.49	m.v, r.s, s.r (0.31%); n.r, s.t (0.39%); m.pj, n.dʒj, r.d (0.47%).
0.50 ... 0.74	ŋ.kj, ŋ.v, r.k, r.n (0.55%); l.b, l.t, ŋ.r (0.71%).
0.75 ... 1.00	r.p, r.t (0.87%); l.vj (0.94%).
1.0 ... 2.4	m.j (1.18%); ŋ.l (1.34%); n.tʃ (1.50%); n.dʒ (2.13%); n.v (2.28%); l.j (2.36%).
2.5 ... 4.9	m.p (2.52%); s.j (2.60%); n.l (2.91%); l.v (3.15%); m.b (3.23%); ŋ.k (3.78%).
5 ... 9	n.t (5.28%); n.d (6.85%); ŋ.j (7.32%); r.j (8.98%).
10+	n.j (25.35%).

ets. As can be expected, bilabials cluster mostly with bilabials (83/112 purely bilabial CC combinations = 74.11%), alveolars with alveolars (317/948 = 33.44%), and velars with velars (59/207 = 28.51%). However, at least for alveolars and velars, the score is even higher with /j/: 52.64% and 44.93%, respectively. /j/ is also the most common second consonant overall, at 47.8% of all consonant clusters; /n.j/ is the most common cluster at a total of 25.35%. Alveolars provide the highest variety of both first and second consonants, with 6 different phonemes making up 74.65% of C₁, and 8 different phonemes making up 28.74% of C₂.

Labiodentals and glottals occur least frequently, on the other hand: There is only one cluster with /v/ as a first consonant, namely, /lv.n/ (0.08%). For /h/, there are two, which are /h.v/ and /h.t/ (0.16%). Altogether, however, there are 97 combinations in /v/ (7.64%)—most commonly /l.v/ (3.15%) and /n.v/ (2.28%)—while there are only 4 in /h/ (0.31%): /n.h/, /s.h/, and twice /ŋ.h/.

At 924 first consonants (72.76%), the nasals /m/, /n/, and /ŋ/ make up the largest group going by manner of articulation, followed by the tap /r/, which appears 175 times (13.78%) as the first consonant. For second consonants, approximants constitute the largest group at 669 combinations (52.68%), followed by 387 pairs with plosives second (30.47%).

1.3 Notes on prosody

1.3.1 Stress

Ayeri uses dynamic accent, that is, stress is based on differences in the loudness of syllables, among others.¹⁷ Which syllable is stressed depends on a mix of which position in a word a syllable occupies and the phonemic shape of it. In fact, English, which also has phonemic stress in pairs such as *record* /'rɛkərd/ (noun) and /rɪ'kɔrd/ (verb) that Ayeri lacks, does a similar thing (examples adapted from Halle 1998: 552):

- (24) *admire* /æd'maɪər/ — *admirable* /'ædmərəbl/ [English]
carnivore /'karnɪvɔr/ — *carnivorous* /kar'nɪvərəs/
ignore /ɪg'nɔr/ — *ignorant* /'ɪgnərənt/

Stress does not stay at fixed intervals in these words and they even change their sound structure a little, but there are a number of variables which can nonetheless be formally described and applied here (564–565).¹⁸ To demonstrate how word stress moves around in Ayeri, the complete declension paradigm for ḡ *niva* ‘eye’ is presented in Figure 1.4.

Figure 1.4: Declension paradigm for Ayeri ḡ *niva* ‘eye’

	Singular		Plural	
TOP	<i>ní.va</i>	‘the eye’	<i>ni.vá.ye</i>	‘the eyes’
A	<i>ni.vǎng</i>	‘eye’	<i>ni.va.jǎng</i>	‘eyes’
P	<i>ni.vǎs</i>	‘eye’	<i>ni.vá.jas</i>	‘eyes’
DAT	<i>ni.vá.yam</i> ¹⁹	‘to the eye’	<i>ni.vá.jyam</i>	‘to the eyes’
GEN	<i>ni.vá.na</i>	‘of the eye’	<i>ni.va.yé.na</i>	‘of the eyes’
LOC	<i>ni.vá.ya</i>	‘at the eye’	<i>ni.vá.jya</i>	‘at the eyes’
CAUS	<i>ni.va.í.sa</i>	‘due to the eye’	<i>ni.va.jí.sa</i>	‘due to the eyes’
INS	<i>ni.vá.ri</i>	‘with the eye’	<i>ni.va.yé.ri</i>	‘with the eyes’

¹⁷ For a discussion of terms, see Kager (2007), for instance.

¹⁸ Halle (1998) takes a generativist approach rather than a more modern Optimality-Theory based one like Kager (2007) does, who only deals with fixed-stress systems in this introductory article, though Halle’s article is still informative. Simplifying a lot, English essentially tries to construct trochaic feet from the right edge of the word. If the last syllable’s vowel is not light, it is skipped and stress moves to the antepenultimate syllable; this process is recursive for words with multiple feet, although some suffixes introduce irregularities in rule application.

¹⁹ Final-syllable stress is possible as well, also in the plural.

It may appear that in the table above, stress is always on the penultimate syllable, which is indeed the case for most forms quoted there, but compare the superficially unmarked form \tilde{n} *niva*, which is disyllabic with stress on the first (= penultimate) syllable, to the agent and patient singular forms, $\tilde{n}vāng$ and $\tilde{n}vās$, respectively. These are also disyllabic, however, they are stressed on the second (= ultimate) syllable. Similarly, compare the agent and patient plural forms to each other: the agent plural form $\tilde{n}vajang$ is trisyllabic and has its main stress on the third (= ultimate) syllable, while the equally trisyllabic patient plural form $\tilde{n}vajas$ is stressed on the second (= penultimate) syllable again.

It should have become clear that even though the basic form \tilde{n} *niva* has first-syllable stress, *ni* will not necessarily carry stress across the whole paradigm. It should also have become clear that the basic algorithm to determine stressed syllables in Ayeri has something to do with counting syllables from the right edge of a word, although some complications need to be factored in. The following sections will try to describe these formally.

Analysis of stress patterns in disyllabic words

The basic foot in Ayeri is a trochee, and for the most part it does not matter whether the syllable is open or closed, or whether there are complex onsets or codas, or no onsets or codas at all:²⁰

- (25) a. \acute{x} \times ||
 ba - *ri* 'pithy, striking'
- b. \acute{x} \times ||
 sa - *yan* 'hole, cave'
 sem - *ba* 'comb'
- c. \acute{x} \times ||
 bri - *ba* 'grace'
 ba - *brya* '(he) mumbles'
 a - *gu* 'chicken'

It can be deduced from words with more than two syllables that stress assignment is trochaic. Stress assignment furthermore runs from right to left, so that in a word with more than two syllables, the last two syllables form a full foot:

²⁰ In the following, a syllable will be marked by $\langle x \rangle$ and receives an acute accent $\langle \acute{} \rangle$ when carrying primary stress, a grave accent $\langle \grave{} \rangle$ when carrying secondary stress, and no accent when unstressed. Feet are marked by horizontal lines $\langle | \rangle$; the end of a word is marked by two horizontal lines $\langle || \rangle$.

- (26) a. × | × × ||
 ba - *ha* - *lan* ‘target, goal’
 jar - *ma* - *ya* ‘pilgrim’
- b. × × | × × ||
 ho - *ra* - *ma* - *ya* ‘sinner’
 ya - *ma* - *na* - *ti* ‘causer’

In the case of (26b), the stressed syllables of the first foot bear secondary stress while those of the second foot bear primary stress. Complications, then, come in the form of syllables ending in /ŋ/, containing a long vowel, or containing a diphthong, or a combination of those features. Ayeri does not have syllables that contain a diphthong and also end in /ŋ/, though, since consonant codas after a diphthong are largely avoided.²¹ Since the presence or the absence of a certain element that is suspected to have an effect on stress assignment is a yes–no decision, we can make a matrix of binary features:

Figure 1.5: Types of heavy syllables

	[+ DIPH, – ŋ]	[– DIPH, + ŋ]	[– DIPH, – ŋ]
[+ LONG]	++	++	++
[– LONG]	+	+	–

The feature matrix above (Figure 1.5) shows the various kinds of syllable types that we will now see have a manipulative effect on trochaic stress assignment. These syllable types can be considered ‘heavy’ in that they attract stress and thus modify the regular assignment of stress to every other syllable from the right edge of a word. For the time being, we will only test their effects on disyllabic words as the most common type. As will be shown in the following example, heavy syllables in ultimate positions attract stress while quasi-regular results are produced when they are in penultimate position and the ultimate syllable is not heavy:

- (27) a. × × ||
 ma - *tay* ‘summer, wet season’
 pa - *dang* ‘mind; heart, mood’
 ka - *nāy* ‘I marry’ (marry=ISG.TOP)
 bras - *yāng* ‘he bathes’ (bathe=3SG.M.A)
 na - *rān* ‘word; speech’
- b. × × ||
 kār - *yo* ‘strong’
 key - *nam* ‘humans, people’
 kan - *ka* ‘mind; heart, mood’

²¹ It might thus be possible to alternatively analyze diphthongs in /ɪ/ as /Vj/ sequences, essentially.

Unfortunately, there are no disyllabic examples for the feature sets [+LONG, –DIPH, +η] and [+LONG, +DIPH, –η] in the first syllable (syllables of the type /C(C(j))V:η/ or /C(C(j))Vɪη/). If there were, they would group with (27b).

So far, we have only looked at heavy syllables combined with regular/light ones. In the following case, however, another property of heavy syllables will become apparent: long syllables outweigh those containing a diphthong or ending in /η/. They are essentially superheavy, which is why some of the fields in Figure 1.5 are marked with two plus signs. The following examples show what happens when heavy syllables are combined with other heavy syllables. Let us start by examining the various combinations possible between [–LONG, +DIPH, –η] and the elements from the [+LONG] row (28a), and the possible combinations between [–LONG, –DIPH, +η] and the [+LONG] row (28b).

- (28) a. × × ||
 bay – *bāy* ‘I govern’ (govern=1SG.TOP)
 say – *lyāng* ‘he sails’ (sail=3SG.M.A)
 kay – *vān* ‘container’
- b. × × ||
 kong – *āyn* ‘we enter’ (enter=IPL.TOP)
 keng – *vāng* ‘you notice’ (notice=2SG.A)
 lang – *-vā* ‘in the most tiresome way’ (tiresome=SUPL)

We can see here that these words have primary stress invariably on the last/long syllable in spite of a heavy syllable preceding in the examples in (28b). The question then is, however, what happens if we invert this order. This is more problematic than it sounds, however, as initial [+LONG, +DIPH, –η] and [+LONG, –DIPH, +η], as well as final [–LONG, +DIPH, +η] do not occur, insofar there will only be one possible combination here—the reverse pattern of ၵၵၵၵၵၵ *lang-vā* ‘in the most tiresome way’ from (28b) above, also compare with (27):

- (29) × × ||
 cā – *nang* ‘love’ (love-A)

There is only one one pattern possible here, which is very little to make a point, however, other words following this syllable pattern, like ၵၵၵၵၵၵ *nāreng* ‘rather’, for example, behave in the same way. A long syllable has precedence over other kinds of heavy syllables, so ၵၵၵၵၵၵ *-nang* does not take away stress from ၵၵၵၵၵၵ *cā-* as one might expect from the examples in (27a). Another question is what happens if we pit elements from the [±LONG] rows against another feature combination of the same row. As above, we will start with the [–LONG] row:

- (30) a. $\times \quad \acute{\times} \quad ||$
 bay - tang ‘blood’
 b. $\times \quad \acute{\times} \quad ||$
 pang - lay ‘goddess’

In the case of examples for [+LONG] pattern combinations, we need to keep in mind again that initial [+LONG, +DIPH, −η] and [+LONG, −DIPH, +η] are not attested, so again, there will only be one possible combination of two syllables with a long vowel:

- (31) $\grave{\times} \quad \acute{\times} \quad ||$
 mā - sāy ‘I traveled’ (PST-travel=ISG.TOP)

Combining two long syllables with each other will result in both being stressed, which is otherwise avoided in Ayeri, as we will see later. Moreover, the following patterns emerge if we combine each pattern with itself; the combinatorial restrictions mentioned above apply again, of course:

- (32) a. $\times \quad \acute{\times} \quad ||$
 kay - vay ‘without’
 dang - reng ‘bell’ (bell-A.INAN)
 b. $\grave{\times} \quad \acute{\times} \quad ||$
 bā - mā ‘parents, mom-and-dad’

As demonstrated in (28), the last heavy syllable will receive primary stress, except if two long syllables collide, in which case the first long syllable will receive secondary stress.

To summarize the above findings:

1. Ayeri assigns trochaic stress from the right edge of a word. A foot thus consists of two syllables, of which the first is stressed.
2. Syllables ending in /η/ or ones containing a diphthong are considered heavy. They attract stress and take it away from a preceding stressed syllable if the following syllable is not stressed already.
3. Syllables containing a long vowel are considered superheavy and override both light and heavy syllables in attracting stress, since long vowels cannot be unstressed.
4. Primary stress is assigned to the last stressable syllable, or otherwise the last heavy syllable. In the rare case of two long/superheavy syllables after another, the first syllable receives secondary stress and reduces in duration.

5. Secondary stress is assigned to syllables that are eligible for word stress but which are not in the final foot.

Analysis of stress patterns in trisyllabic words

So far, we have only considered all the possible combinations of two heavy and light syllables. Doing the same for all combinations of three and more syllables would be possible, though the list of examples were to become even longer. Since the feature pair $[\pm \text{DIPH}, \pm \eta]$ behaves the same way throughout and both features are in complementary distribution, we need not test iterations of them separately, but can subsume them under the label $[\pm \text{HEAVY}]$. The parameters that need testing, then, are $[\pm \text{HEAVY}]$ in combination with $[\pm \text{LONG}]$. There are 4 possible outcomes for these two features, which in the case of three syllables leads us to $(2 \times 2)^3 = 64$ theoretically possible combinations. For this reason, I want to point out just a few cases, since the general rules sketched out above still apply.

First, let us look at $[+ \text{HEAVY}, - \text{LONG}]$ combined with $[- \text{HEAVY}, - \text{LONG}]$ in all positions (Figure 1.6). Finding words that fit the respective permutations is not too much of a problem, especially in cases where there is only one heavy syllable.

Figure 1.6: Stress patterns for $[+ \text{HEAVY}, - \text{LONG}]$ in trisyllabic words

$-H -H +H$	<i>prantanley</i>	$\times \times \acute{x} $	‘question’ (question-P.INAN)
$-H +H -H$	<i>sarayya</i>	$\times \acute{x} \times $	‘(he) bows’ (bow-3SG.M)
$+H -H -H$	<i>taykondam</i>	$\times \acute{x} \times $	‘break (n.)’
$-H +H +H$	<i>ralanghay</i>	$\times \times \acute{x} $	‘thumbnail’
$+H -H +H$	<i>kaybunay</i>	$\acute{x} \times \acute{x} $	‘by the way’
$+H +H -H$	<i>maykongas</i>	$\times \acute{x} \times $	‘harbor’ (harbor-P)
$+H +H +H$	<i>panglay-kay</i>	$\acute{x} \times \acute{x} $	‘a few goddesses’ (goddess=few)

It becomes clear from Figure 1.6 that the rules stated at the end of the previous section (p. 37) also hold in the case of trisyllabic words whose syllables alternate short syllables based on the $[\pm \text{HEAVY}]$ feature: ပြဏတၢ်လၢၤ *prantanley*, ရၢလၢၣ်ဂၢၤ *ralanghay*, ကၢၤပုၤနီၤ *kaybunay*, and ပၢၣ်လၢၣ်ကၢၤ *panglay-kay* receive final-syllable stress since this is their last heavy syllable. The first syllables of တၢ်ယၢၢ် *taykondam* and မၢၤပုၤကၢၤ *maykongas*, on the other hand, lose the secondary stress they would normally be assigned as two stressed syllables after another are normally avoided; the requirement of long syllables to not be unstressed does not come into effect here. တၢ်ယၢၢ် *taykondam* is also an example for the rule that even if a syllable is not heavy, the last syllable that can be assigned stress will receive primary stress.

Carrying out the same analysis as above and moving the feature [+ LONG] through the various positions, we receive the results depicted in Figure 1.7.²² Since long syllables override stress of both light and heavy syllables as pointed out above (p. 37), the example words in this chart contain both of these syllable types. It was not too hard finding examples for all the slots in this case either, except that words with two long syllables in succession are rather rare. Still, only the case of three long syllables must remain unattested.²³

Figure 1.7: Stress patterns for [\pm HEAVY, + LONG] in trisyllabic words

-L -L +L	<i>peraysān</i>	x x x	‘paste’
-L +L -L	<i>raypānya</i>	x x x	‘at the stop’ (stop-LOC)
+L -L -L	<i>nōneri</i>	x x x	‘deliberate, intentional’
-L +L +L	<i>mə-cān-cān</i>	x x x	‘whatever fling’ (whatever=fling)
+L -L +L	<i>sānisān</i>	x x x	‘copula; clutch (n.)’
+L +L -L	<i>lēāyon</i>	x x x	‘manwhore’
+L +L +L	—	—	—

Again, we can see that long syllables attract stress, in that the final syllables of *peraysān* and *sānisān* are stressed even though the penultimate syllable is heavy on the virtue of containing a diphthong. As it is in an unstressed position and there is no requirement for the syllable to be stressed, the first syllable of *raypānya* loses stress adjacent to the stressed long penultimate syllable. *nōneri* and *lēāyon* display a secondary-stressed and a primary-stressed syllable next to each other, in the first case due to the rule that long syllables must not be unstressed and *-eri* forming a valid disyllabic foot that receives regular trochaic stress, and in the second case due to two long syllables next to each other, of which the first—again—must not be unstressed. *mə-cān-cān* is interesting insofar as the long-syllable stress rules operate on the second foot regularly, while the marker *mə-* ‘whatever’ is by default unstressed, so even if it is added to stressed monosyllabic words like *hin* ‘box’, the foot of *mə-hin* ‘which box so ever’ would appear iambic, even though the syllable *hin* itself is not heavy.

²² For more precision, modifications will be made to the symbols given in footnote 20: let a double acute (ˆˆ) denote superheavy syllables with primary stress, and a double grave (˘˘) denote superheavy syllables with secondary stress.

²³ It would be possible to construct a word with three long syllables if the habitative suffix *-asa* did not delete the vowel at the end of the verb stem if there is one. *māsāy* ‘I traveled’ (PST-travel=ISG.TOP) would then become **māsāsāy* ‘I used to travel’ (PST-travel-HAB=ISG.TOP) instead of the actual form *māsasāy*; the verb stem is *asa-* ‘travel’.

A further exception is formed by monosyllabic quantifying clitics like ၵ်း -*ben* ‘all, every’ or ၵ်း -*ngas* ‘almost’. These are unstressed also when following an unstressed syllable of their host if they contain a short vowel.

Stress in compounds

Ayeri has a number of lexicalized compound nouns that are treated as one word morphologically (33a). This is in contrast to compounds that are not as established terms, or formed ad hoc (33b):

- (33) a. *Ang bengay kardangirayya ya Litareng.*
 Ang beng-ay.Ø kardang.iray-ya ya Litareng
 AT attend=1SG.TOP school.high-LOC LOC= Litareng
 ‘I attend university in Litareng.’
- b. *Ang pasyye Pila sungkoranyam kibas.*
 Ang pasy-ye Ø=Pila sungkoran-yam kahas
 AT be.interested.in-3SG.F TOP=Pila science-DAT map
 ‘Pila is interested in geography.’

For purposes of surveying stress patterns, we will only deal with the kind in (33a), though it may be noted that when not being overtly inflected, the second kind of compound will be treated as a word as well: ၵ်း ၵ်း ၵ်း *sungkorankihas* ‘geography’. Another kind of indivisible compound as in (33a) is one formed from reduplication, for instance, ၵ်း ၵ်း *kusang-kusang* ‘model’, from ၵ်း *kusang* ‘double’. Figure 1.8 gives several examples along with their stress patterns. As a reference for the various rules in operation, consider the list above (p. 37).

The first word, ၵ်း ၵ်း *apan-apan*, is not very noteworthy but I included it nonetheless as a reference for regular stress assignment to light syllables. The word decomposes into two feet, each of them has trochaic stress, which does not change when reduplicated. Per rule, the first syllable of the word receives secondary stress while the penultimate syllable bears primary stress. ၵ်း ၵ်း *kusang-kusang* is following the normal rules as well in that a heavy syllable takes stress from a light one. This does not change in reduplication.

ၵ်း ၵ်း *depangcāti* is noteworthy since it follows the same stress pattern as ၵ်း ၵ်း *apan-apan* in spite of consisting of one foot with a heavy second syllable (ၵ်း *de-pang*) and another with a superheavy first syllable (ၵ်း *cāti*). To avoid a clash, stress is not shifted to the heavy syllable in ၵ်း *depang*, since it is not strictly necessary for it to be stressed:

- (34) $(*dépang \rightarrow depáng) + cāti \rightarrow \left\{ \begin{array}{l} *depàng + cāti \\ dèpang + cāti \end{array} \right\}$

Figure 1.8: Examples of stress patterns in compounds

<i>malingkaron</i>	ᵂ ᵂ ᵂ ᵂ	<i>maling</i>	‘shore’	<i>karon</i>	ᵂ ᵂ	‘water’
<i>māvaṅganeng</i>	ᵂ ᵂ ᵂ ᵂ	<i>māva</i>	‘mother’s siblings’	<i>ganengan</i>	ᵂ ᵂ ᵂ	‘siblings’
<i>pikunanding</i>	ᵂ ᵂ ᵂ ᵂ	<i>piku</i>	‘mustache’	<i>anding</i>	ᵂ ᵂ	‘lip’
<i>sapayyila</i>	ᵂ ᵂ ᵂ ᵂ	<i>sapay</i>	‘limbs’	<i>yila</i>	ᵂ ᵂ	‘foot’

In the case of *မာလင်္ကာရံ* *malingkaron* again the rule operates that prohibits two stressed non-long syllables after another. Thus, even if the first component *မာလင်္ကာ* *maling* contains a heavy syllable, stress will not move there. In *လတ်ကဲမာ* *latunkema*, the syllable /tun/ is assimilated to [tʊŋ] before the /k/ onset of the next syllable. For one, however, this does not make it heavy, and second, even if it did, stress would stay on the first syllable of the word for the same reason as in *မာလင်္ကာရံ* *malingkaron*. The same rule of stress hiatus avoidance operates in *ဆာပယျိလာ* *sapayyila*.

Besides the shortening of the second component of the compound, *မာသင်္ဂရာ* *māva-ganeng* retains the stress pattern of its constituents. Since /ma:/ is not in a final foot, it receives secondary stress. Moreover, *မာသင်္ဂရာ* *māvaganeng* and *ပိကုနင်္ဂ* *pikunanding* both show that it is acceptable for two light syllables to follow each other.

1.3.2 Intonation

Peterson (2015: 66) writes that if “you’re creating a language on your own and you’re the only speaker, intonation is usually not high on the list of features to focus on, but intonational flavoring is well worth it (read: crucial) when it comes to making an authentic language.” Indeed, this has so far been a rather neglected topic in my work on Ayeri. Even though I made a handful of recordings in the past, I have never considered intonation much. Yet, of course, the spoken words in those recordings do not sound like robot speech either, so there must be intonational patterns that I have been subconsciously applying.²⁴

Since intonation contours are notoriously difficult to display in print, I will give very approximate graphs of pitch in the respective examples for each surveyed pattern. Certainly there will be other patterns as well which would require more detailed gradations, but for the time being, I will only try to briefly describe those that are most prominent.

Declarative statements

Declarative statements have a gradually falling pitch contour based around an average pitch height, not deviating considerably on both ends:

‘The North Wind blew with all of his might.’

²⁴ Whenever this happens, the fallback is likely to be a mix of German and English, since those are the languages I am most familiar with.

Yes-no questions

Since Ayeri does not use a particle or word order to mark closed questions as such, intonation is used to mark the difference from a declarative statement. To achieve a strong contrast, questions exhibit gradually rising intonation:

(36)

<i>Ang</i>	<i>gibayo</i>	<i>Pintemis</i>	<i>minganeri-ben</i>	<i>yona?</i>
Ang	giha-yo	Ø=Pintemis	mingan-eri=hen	yona
AT	blow-3SG.N	TOP=North Wind	ability-INS=all	3SG.N.GEN.

‘Did the North Wind blow with all of his might?’

‘Wh-’ questions

Unlike English, Ayeri marks open questions with an in-situ question word. Open questions are thus marked by the question word causing a sharp rise and fall in the overall contour of the question. The first half of the clause has the rising contour of a question, the second half has gradually falling pitch.

(37)

<i>Ang</i>	<i>engyo</i>	<i>mico</i>	<i>sinya</i>	<i>luga</i>	<i>toya</i>	<i>sam?</i>
Ang	eng-yo	mico	sinya-Ø	luga	toya	sam
AT	be.more-3SG.N	strong	who-TOP	among	3PL.N.LOC	two

‘Who was the stronger of the two?’

Lists

List statements have the general gradual downward slope of declarative statements, but the individual items can nonetheless be marked by a pitch rise on the primary accent of each item.

(38)

<i>Le</i>	<i>vacyeng</i>	<i>seygo,</i>	<i>disu,</i>	<i>betay</i>	<i>nay</i>	<i>vasra.</i>
Le	vac-yeng	seygo-Ø,	disu-Ø,	betay-Ø	nay	vasra-Ø
PT.INAN	like=3SG.F.A	apple-TOP,	banana-Ø,	berry-Ø	and	nut-Ø

‘She likes apples, bananas, berries and nuts.’

Complement and relative clauses

Complement clauses are characterized by the short spike at the end of the preceding main clause followed by a short break which together signal the beginning of a new syntactic unit within the context of the current sentence, which is broadly similar to list statements. Otherwise, statements with complement clauses as well bear the overall downward-sloping contour of declarative statements if included in such.

- (39) 
- | | | | | | |
|------------|--------------|-----------------|---------------|-------------|-----------------|
| <i>Ang</i> | <i>manga</i> | <i>rantong,</i> | <i>engyo</i> | <i>mico</i> | <i>sinyāng.</i> |
| Ang | manga | ran-tong, | eng-yo | mico | sinya-ang |
| AT | PROG | argue=3PL.N.A, | be.more=3SG.N | strong | who-A |
- ‘They were arguing who is stronger.’

Relative clauses, on the other hand, do not receive special prosodic marking, but are treated the same as other basic sentence types. They display a continuous downward slope if part of a declarative statement, or a continuous upward slope if part of a question:

- (40) a. 
- | | | | | | |
|---------------|----------------|-----------|--------------------------|-------------|----------------|
| <i>Lugaya</i> | <i>asāyāng</i> | <i>si</i> | <i>sitang-naykonyāng</i> | <i>kong</i> | <i>tovaya.</i> |
| Luga-ya | asāya-ang | si | sitang-naykon-yāng | kong | tova-ya |
| pass-3SG.M | traveler-A | REL | self=wrap=3SG.M.A | inside | cloak-LOC |
- ‘A traveler passed who had wrapped himself into a cloak.’
- b. 
- | | | | | | |
|----------------|---------------|-----------|-----------|----------------|--------------|
| <i>Adareng</i> | <i>asāyās</i> | <i>si</i> | <i>le</i> | <i>ninyāng</i> | <i>tova?</i> |
| Ada-reng | asāya-as | si | le | nin-yāng | tova-Ø |
| that-A.INAN | traveler-P | REL | PT.INAN | wear=3SG.M.A | coat-TOP |
- ‘Is that the traveler who wore the coat?’

Contrast

Ayeri uses a kind of topic system for highlighting constituents in a clause by morphosyntactic means, but this is still different from emphasis on semantic grounds, for example when the speaker wants to highlight a semantic difference in the same syntactic position, as in the following example, which presents a possible answer to the question posed in (40b):

(41)

Adareng asāyās si le nin-yāng kegan.
 Ada-reng asāya-as si le nin-yāng kegan-Ø
 that-A.INAN traveler-P REL PT.INAN wear=3SG.M.A hat-TOP

‘It is the traveler who wore the *hat*.’

We can see here a spike towards the end of the utterance where the word ^{𐄀𐄁𐄂𐄃} *kegan* ‘hat’ is placed. This word receives extra stress for contrast with ^{𐄀𐄁} *tova* ‘coat’, which is what the other person had asked about.

2 Writing system

In the previous chapter, example words were given in Ayerī's script,  *Tabano Hikamu*, wherever possible. Thus, it seems advisable to include a description of Ayerī's native writing system here as well. Literally,  *Tabano Hikamu* means 'Round Script' (script round), which is an old formation based on the word  *taban-* 'write' that stuck. The current word for 'script' is  *tabanan* 'writing'. Tahano Hikamu was originally named thus because of an earlier draft for a script that never made it very far beyond the drawing board and which was a lot more angular and boxy, see Figure 2.1—Tahano Hikamu was a lot more bubbly in comparison, especially early on (Figure 0.2).¹

As we have seen in the previous chapter, Ayeri's prosody strongly emphasizes the syllable as a unit. Thus, it is not a surprise that Ayeri's native script, Tahano Hikamu, is an alphasyllabary similar to the Brāhmī alphabets of India and Southeast Asia (Salomon 1996; Court 1996). Scripts like these are

based on the unit of the graphic “syllable” [...], which by definition always ends with a vowel (type V, CV, CCV, etc.). Syllables consisting of a vowel only (usually at the beginning of a word or sentence) are written with the *full* or *initial vowel signs* [...]. But when, as is much more frequently the case, the syllable consists of a consonant followed by a vowel, the vowel is indicated by a diacritic sign attached to the basic sign for the consonant [...]. (Salomon 1996: 376)

For Tahano Hikamu the definition that a syllable consisting only of a vowel is written with an initial vowel sign is only true under certain circumstances, as we will see below. Moreover, Brāhmī scripts are often characterized by conjuncts of clustered consonants which may become quite large and sometimes behave in an idiosyncratic way. Consonant conjuncts like Devanāgarī त्व ⟨tva⟩ from त ⟨ta⟩ + व ⟨va⟩ or idiosyncratic conjuncts like क्ष ⟨kṣa⟩ for क ⟨ka⟩ + ष ⟨ṣa⟩ are not known in Tahano Hikamu, however. Tahano Hikamu also does not know subscript notation for consonant clusters and special diacritics marking coda consonants like in Javanese (Kuipers and McDermott 1996: 478–479). This does not mean, however,

¹ Unfortunately, there is no documentation of the Box script surviving that I know of.

Figure 2.1: Box script and Hikamu

(a) Old and aborted draft: Box script

(b) Ayeri's native script: Tahano Hikamu

that final consonants are simply omitted in writing, since closed syllables are reasonably common enough in Ayeri to warrant indicating them. Thus, there is “a special mark to eliminate the vowel of the previous syllable, thereby leaving a consonant in a syllable-final position.” (Kuipers and McDermott 1996: 476) That is, a diacritic exists which marks the absence of an inherent vowel, rendering the syllable consonant-only.

Another difference from Brāhmī-family scripts is that vowel length and diphthongs in [i] are indicated by dedicated diacritics, so the long vowels are not doubled versions of their short counterparts. Like in Kharoṣṭhī—another historically important ancient script of India—initial vowels are not represented by unique graphemes but they are all written like post-consonantal vowel diacritics (Salomon 1996: 377), though in Tahano Hikamu with a character without an inherent sound value. For this reason, the character is indicated in the table below as \emptyset ; its native name is ṛṇṇ *ranyan* ‘nothing’.² Similar to a number of Brāhmī scripts, Tahano Hikamu puts diacritics not only below or above consonant bases, but also before them. This, however, is not limited to vowel graphemes as in Devanāgarī ि ⟨i⟩ or Javanese ꦺ ⟨e, é/è⟩ (Kuipers and McDermott 1996: 478).³

² I will give the native names of graphemes here, but will refer to them by their English names for clarity in the running text.

³ Kuipers and McDermott (1996) do not say, but it looks likely to me that both are related, since they are both functionally the only prepended vowel diacritics and both represent a high front sound.

2.1 Consonants

Tahano Hikamu is mainly based on consonant bases that are modified by diacritics. Since the vowel /a/ is so highly frequent in Ayeri, it is also the vowel that is *inherent* to every consonant grapheme if not further modified by vowel diacritics. Consonant letters are simply referred to as *pa*, *ta*, *ka*, ... Figure 1.1 displays all the main consonants. The customary collation is—similar to the IPA table—roughly grouping the letters according to their sound value by anteriority (front → back) and sonority (low → high). The script is monocameral, that is, there is no distinction between capital letters and minuscule letters as in the Latin, Greek, Cyrillic, Georgian, and Armenian alphabet. It is also written in lines from left to right.

Figure 2.2: The consonant graphemes of Tahano Hikamu

/pa/	/ta/	/ka/	/ba/	/da/	/ga/
ᠠ	ᠲ	ᠬ	ᠪ	ᠳ	ᠭ
/ma/	/na/	/ŋa/	/va/	/sa/	/ha/
ᠮ	ᠨ	ᠨᠠ	ᠪᠠ	ᠰ	ᠬᠠ
/ra/	/la/	/ja/	/Ø/		
ᠷ	ᠯ	ᠵ	ᠯ		

ᠯ, which in Ayeri has no sound value but is used as a base for initial vowels, may also serve as the character for /ʔa/. What is, moreover, interesting about ᠨᠠ ⟨nga⟩ is that even though before, /ŋ/ was treated strictly as a coda consonant in the previous chapter, it is in fact treated as an onset consonant in writing if a vowel is following:

- (1) ᠠ + ᠨᠠᠭᠢᠰ
 /pa/ /ŋis/
 ᠠᠨᠠᠭᠢᠰ *pangis* /paŋ.is/ ‘money’

Tahano Hikamu knows a few ligatures. First of all, when two ᠨ ⟨na⟩ are in succession within a word, they will form a ligature ᠨᠠ ⟨nana⟩:

- (2) ᠨ + ᠨ → ᠨᠠ
 /na/ /na/ /nana/

This is distinct from conjuncts like in Devanāgarī et al., though, since the unmodified sound value will still be /nana/, not */nna/, so the inherent vowel of each ᠨ

⟨na⟩ is not deleted, and each ᳵ ⟨na⟩ retains the ability to be modified by diacritics. Tahano Hikamu also has a few ligatures of the kind you would find in Brāhmī scripts, however:

- (3) a. ᳵ᳚ ⟨kwa⟩ ← ᳵ ⟨ka⟩ + ᳚ ⟨va⟩,
 b. ᳵ᳛ ⟨tsa⟩ ← ᳵ ⟨ta⟩ + ᳛ ⟨sa⟩, and
 c. ᳵ᳜ ⟨ksa⟩ ← ᳵ ⟨ka⟩ + ᳜ ⟨sa⟩.

These conjunct letters are, however, not normally employed by Ayeri. Figure 2.3 shows all additional consonants, added to write other languages. Individual languages may adapt the sound values slightly to fit their own purposes.

Figure 2.3: Additional consonant graphemes of Tahano Hikamu

/fa/	/wa/	/tsa/	/za/	/ja/	/ʒa/
ᳶ	᳷	᳸	᳹	ᳺ	᳻
/ɕa/	/ksa/	/kwa/	/xa/	/ɣa/	
᳼	᳽	᳾	᳿	ᳺ᳚	

2.2 Vowels

As mentioned above, vowels are written as diacritics that are added to consonants. In principle, every consonant has two slots for vowels, a primary one atop it, and a secondary one below it. Vowels added to consonants in the primary slot delete their inherent /a/:

- (4) $\text{ᳵ} \rightarrow \text{ᳶ}$
 /pa/ /pe/

Figure 2.4: Primary vowel graphemes of Tahano Hikamu

	/i/	/e/	/a/	/o/	/u/	/ə/	/au/
Diacritics	ᳶ	᳷	(ᳵ)	᳹	ᳺ	᳻	᳼
Independent	ᳶ	᳷	᳸	᳹	ᳺ	᳻	᳼

Figure 2.4 gives the primary vowel signs. Of the vowel signs given there, only ခ် ⟨ə⟩ is not used in Ayeri. ခ် ⟨au⟩ is the only diphthong for which a dedicated grapheme exists, even though its occurrence is rather limited. The independent vowel graphemes are used at the beginning of words or inside words when there is no other way to spell the vowel, which is occasionally the case for secondary vowels. Secondary vowels are vowels that are not parts of diphthongs (even though another language might use them to spell diphthongs that are not covered by default), but follow the vowel of a syllable directly. They are attached underneath a consonant base, for example:

- (5) ဟ → ဟ် → ဟျ
 /ja/ /je/ /jea/

In fact, the principle that every consonant base with its diacritics represents one syllable is slightly violated here, which is also the reason why secondary vowels very occasionally need to be spelled as independent vowels, for example when the secondary vowel is long, as in the word ရွာန် *ruān* ‘duty’:

- (6) ဂ် → ဂ်ရှ် (ရှ်)
 /ru/ /rwa:/ /ru:a/

Example (6) uses a diacritic, ရှ်, to indicate length. If it is put directly under ဂ် *ru* (the ခ် diacritic moves down where it is not in the way), the syllable will incorrectly spell /ru:a/ instead of the intended /rua:/. This is because diacritics modify consonants and primary vowels, but there is no way to modify a secondary vowel directly. Figure 2.5 gives a list of secondary vowels corresponding to that of primary vowels above. The vowels as well are just referred to by their sound value; ‘primary’ and ‘secondary’, ‘superscript’ and ‘subscript’ or ‘upper’ and ‘lower’ may be chosen to disambiguate their positions; the native names may use ရှ် *iray* ‘high’ and ရှ် *eyra* ‘low’ to disambiguate, so ရှ် *e iray* denotes the superscript ⟨e⟩ diacritic while ရှ် *e eyra* denotes its subscript counterpart.

Figure 2.5: Secondary vowel graphemes of Tahano Hikamu

/i/	/e/	/a/	/o/	/u/	/ə/	/au/
ိ	ဲ	ာ	့	ု	့	ွ

As a further exception, those consonant bases with an ascender (ခ် ⟨ka⟩, ည် ⟨da⟩, ည် ⟨za⟩) move the primary vowel to the secondary slot below the consonant by default while indicating the vacancy of the primary slot at the top with a dot. This is done to avoid crossing the ascender of the consonant with a vowel diacritic:

$$(7) \quad \begin{array}{ccc} \text{𐌵} & \rightarrow & \text{𐌵} & \rightarrow & \text{𐌵} \\ /ka/ & & /ka.i/ & & /ki/ \end{array}$$

If the primary vowel slot were not silenced by the \circ diacritic, it could reasonably be assumed that the consonant is not losing its inherent /a/ and the vowel below the consonant indicates a secondary vowel, spelling /CaV/. If, however, a secondary vowel is *actually* added, primary and secondary vowels will be assigned the regular primary and secondary slots, respectively, again (8a). This condition also holds true for subscript diacritics (8b).

$$(8) \quad \begin{array}{ll} \text{a.} & \begin{array}{ccc} \text{𐌵} & \rightarrow & \text{𐌵} \\ /ki/ & & /ki.e/ \end{array} \\ \text{b.} & \begin{array}{ccc} \text{𐌵} & \rightarrow & \text{𐌵} \\ /ki/ & & /ki:/ \end{array} \end{array}$$

The order of secondary vowels and subscript diacritics is iconic insofar as it follows the order of sounds in the syllable. Thus, secondary vowels appear below the consonant-doubling diacritic, 𐌵 , while they appear above the syllable-final homorganic nasal diacritic, 𐌶 :

$$(9) \quad \begin{array}{ll} \text{a.} & \begin{array}{ccc} \text{𐌵} & \rightarrow & \text{𐌵} \\ /ppa/ & \rightarrow & /ppea/ \end{array} \\ \text{b.} & \begin{array}{ccc} \text{𐌵} & \rightarrow & \text{𐌵} \\ /peN/ & \rightarrow & /peaN/ \end{array} \end{array}$$

2.3 Diacritics

We have already encountered a few diacritics, though Tahano Hikamu comes with a lot more, some of which undergo non-trivial positioning and repositioning rules. As vowels are primarily expressed as superscripts, diacritics are primarily realized as subscripts, so in the following I will first describe subscript diacritics; then prepended diacritics, which Ayeri also has a number of, both as graphemes in their own right and as allographs of other subscript diacritics; and then, lastly, superscript diacritics.

2.3.1 Subscript diacritics

Figure 2.6 shows the bottom-attaching diacritics. The ‘large diacritics’ cause the secondary slot of consonants to move down below the diacritic. ‘Small diacritics’

can attach in this place as well as secondary vowels, as does the homorganic nasal diacritic ၀ in this diacritic-fraught example:

- (10) $\text{တၢ်} + \text{ပုလၢ်} \rightarrow \text{တၢ်ပုလၢ်}$
 /tʃa:n/ /pu'loi/ /,tʃa:mpu'loi/
 တၢ်ပုလၢ် *cāmpuluy* ‘heterosexual’

It also needs to be noted that diacritics like ၀ are applied progressively to words as a whole, not stopping at morpheme and syllable boundaries, so even though *toryeng* ‘she sleeps’ may be composed of တၢ်: *tor-* ‘sleep’ + ပုလၢ် *-yeng* (=3SG.F.A) and syllabifies as /tor.'jeŋ/, the spelling is not *တၢ်ပုလၢ် as one might expect, but တၢ်ပုလၢ်.

Even though the primary position for small diacritics is underneath consonants, the diacritic deleting the inherent vowel, ၀, very commonly also appears after a consonant letter at the end of words:

- (11) ယ နီမရဲင် ပာဏ ၃၁၁၃၃၃။
 Ya nimreng pangan narānyena.
 Ya nim-reng pangan-Ø narān-ye-na
 LOCT appear=3SG.INAN.A end-TOP word-PL-GEN

‘It appears at the end of words.’

This strategy is advantageous in that Tahano Hikamu leaves very little space between individual words: ယနီမရဲင်ပါဏ၃၁၁၃၃၃။ With the dot after the consonant, word boundaries are more visible.

2.3.2 Prepended diacritics

Example (10) leads us directly to the next class of diacritics—ones that are prepended to the consonant letter, either because they are simply placed there or because of allography. Let us first list those diacritics that appear in front of consonants obligatorily (Figure 2.7).

As Figure 2.7 shows, the only obligatorily prepended diacritic that Ayeri uses is the one that marks diphthongs, ၃၀. It needs to be noted here that ၃၀ changes into ယ (ya) proper when a vowel follows, but stays ၃၀ when a ယ (ya) follows:

- (12) a. ယုဟ် *baday* ‘hero’ → ယုဟ် (*ယုဟ်) *badayang* ‘the hero’ (hero-A);
 b. ခိဃ် *tipuy* ‘grass’ → ခိဃ် (*ခိဃ်) *tipuyya* ‘in the grass’ (grass-LOC).

⁴ In a Tahano Hikamu orthography I devised for English once, ၁၀ was used for /ə/, as in the NURSE vowel in American English: ၁၀ nurse.

Figure 2.7: Obligatorily prepended diacritics of Tahano Hikamu

Native name	Function	Example
၂ [○] လှံတံခွေ <i>lentankusang</i> 'double-sound'	Marks a diphthong with /ɪ/	ပံ <i>pe</i> → ပံ၂ <i>pey</i>
၃ [○] တီလံဗေပ <i>tilamaya</i> 'changer'	Marks raised vowels (i.e. umlaut; not used in Ayeri)	ပံ <i>po</i> → ပံ၃ <i>/pø/</i>
၃ [○] ဟိယံဗေပ <i>hiyamaya</i> 'roller'	Marks retroflex consonants (not used in Ayeri) ⁴	တံ <i>ta</i> → တံ၃ <i>/tʰa/</i>

Figure 2.8: Allographically prepended diacritics of Tahano Hikamu

Native name	Function	Example
၁ [○] တီပာတီမာရ် <i>tupasati marin</i> 'anterior long-maker'	Lengthens the primary vowel of the syllable	ဟံ <i>sya</i> → ဟံ၁ <i>syā</i> , နံ <i>na</i> → နံ၁ <i>nā</i>
၂ [○] ပာမာရ် <i>ya marin</i> 'anterior ya'	⟨ya⟩ following another consonant, also across syllables.	နံ <i>na</i> → နံ၂ <i>nya</i>
၃ [○] ရိယာပာမာရ် <i>ringaya marin</i> 'anterior raiser'	Also used as an allograph for the palatalization proper diacritic.	ဟံ <i>/sʰa/</i> → ဟံ၃ <i>/sʰj/</i>
၁ [○] ဟိယာပာမာရ် <i>ulangaya marin</i> 'anterior breather'	(Pre-)Aspiration or frication of a consonant (not used in Ayeri)	ကံ <i>nga</i> → ကံ၁ <i>/ŋʰa/</i> ; တံ <i>ta</i> → တံ၁ <i>/tʰa/</i>

Besides ᳵ , there are also a number of diacritics that are also obligatorily prepended to consonants, but do so as context-sensitive allographs (Figure 2.8). The selection of the variant diacritics is not random or up to the aesthetic eye of the writer (even though the device itself is certainly a matter of aesthetics), but it is governed by rules. The prepended forms listed in Figure 2.8 are thus triggered

1. when there is no stem or bowl for the regular subscript diacritic to attach to, which is the case for ᳵ <na>, ᳶ <nga>, ᳷ <va>, and ᳸ <wa>:

$$\begin{array}{ll}
 (13) \quad \text{a. } \text{ᳵ} \rightarrow \text{ᳵᳵ} & \text{c. } \text{᳷} \rightarrow \text{᳷᳷} \\
 \quad \quad \quad /na/ & \quad \quad \quad /va/ \\
 \quad \quad \quad /na:/ & \quad \quad \quad /va:/ \\
 \quad \quad \quad \text{b. } \text{ᳶ} \rightarrow \text{ᳶᳶ} & \text{d. } \text{᳸} \rightarrow \text{᳸᳸} \\
 \quad \quad \quad /ŋa/ & \quad \quad \quad /wa/ \\
 \quad \quad \quad /ŋa:/ & \quad \quad \quad /wa:/
 \end{array}$$

2. when a large subscript diacritic would be added after another large subscript diacritic—this position can only be occupied once, so further large subscripts are prepended:

$$\begin{array}{ccccccc}
 (14) & & + \text{ᳶ} & & + \text{᳷} & & + \text{᳸} \\
 \text{ᳵ} & \rightarrow & \text{ᳵᳶ} & \rightarrow & 2\text{ᳵᳶ} & \rightarrow & 2\text{ᳵᳶ᳷} \\
 /ta/ & & /tʰa/ & & /tʰja/ & & /tʰji/ \\
 & & & & & & /tʰji:/
 \end{array}$$

The order of diacritics follows the logic of the respective language's phoneme inventory, so if there are, for example, retroflex consonants and both dental and retroflex consonants can be aspirated, retroflexion would be marked first, then aspiration. If there is a palatalization contrast on top of this, the diacritic would be added after aspiration.

When adding large diacritics to stemless consonants, they are prepended from the beginning, as we saw in (13), and just like in (14), this principle continues:

$$\begin{array}{ccccccc}
 (15) & & + \text{᳷} & & + \text{᳸} & & + \text{ᳵᳵ} \\
 \text{ᳵ} & \rightarrow & 2\text{ᳵ} & \rightarrow & 22\text{ᳵ} & \rightarrow & 3ᳵ2ᳵ \\
 /na/ & & /nʲa/ & & /nʲa:/ & & /nʲa:ɿ/
 \end{array}$$

3. with consonants directly following ᳵ <na>, to avoid a clash with its swash:

$$(16) \quad \underset{/na/}{\text{န}} + \underset{/pa:/}{\text{ပ}} \rightarrow \underset{/napa:/}{\text{နပ}} \quad (*\text{နပ})$$

An exception to this exception occurs, however, when the consonant is not directly following. In this case, no reordering happens, only န ⟨na⟩ *may* reduce its swash in size to accommodate the following prepended diacritic:⁵

$$(17) \quad \underset{/na/}{\text{န}} + \underset{/pai/}{\text{ပိ}} \rightarrow \underset{/napai/}{\text{နပိ}} \quad (? \text{နပိ})$$

4. in other cases where a clash of subscript diacritics needs to be avoided:

$$(18) \quad \underset{/di/}{\text{သိ}} + \underset{/pa:/}{\text{ပ}} \rightarrow \underset{/dipa:/}{\text{သိပ}} \quad (*\text{သိပ})$$

Alternatively, the following solution is permissible:

$$(19) \quad \underset{/di/}{\text{သိ}} + \underset{/pa:/}{\text{ပ}} \rightarrow \underset{/dipa:/}{\text{သိပိ}}$$

When two long syllables follow each other, as in *bāmā* ‘mom-and-dad’, one of the length diacritics should definitely be pulled to the front:

$$(20) \quad \begin{array}{l} \underset{/ba:/}{\text{မိ}} + \underset{/ma:/}{\text{မိ}} \rightarrow \underset{/ba:ma:/}{\text{မိမိ}} \quad (? \text{မိမိ}) \\ \text{or:} \quad \underset{/ba:/}{\text{မိ}} + \underset{/ma:/}{\text{မိ}} \rightarrow \underset{/ba:ma:/}{\text{မိမိ}} \end{array}$$

⁵ The font I am using here is designed so that the reduced combination looks nicer, but if unreduced, န ⟨na⟩’s swash is not so long as to cross the descender of ပ either in this particular case.

Ayeri's standard position for diacritics is below consonants, but sometimes it is nicer to put them on top, especially for the letter ɹ ⟨na⟩ due to its swash, as well as for ɻ ⟨va⟩ since the space below its flag is empty otherwise, thus not providing much of a visual connection. The only diacritic that is normally attaching to the top of consonants is that for the glottal stop—we have already encountered its subscript allograph earlier. Since Ayeri's phoneme inventory does not possess a phonemic glottal stop or glottalization, this diacritic is not used in Ayeri. The list of superscript diacritics is given in Figure 2.9.

	Native name	Function	Example
◌ံ	ꨀ᩵ᩁᩬᩅ᩠ᩉᩣᩴ <i>gondaya ling</i> ‘upper extingisher’	Deletes inherent /a/ of consonant, e.g. in consonant clusters or closed syllables	ᩃᩃ <i>vara</i> → ᩃᩄ <i>vra</i>
◌ဲ	ꨀ᩶ᩱ᩵ᩁᩬᩅ᩠ᩉᩣᩴ <i>vināti ling</i> ‘upper nasalizer’	Indicates a homorganic nasal or nasalizes the vowel, depending on language/context	ᩃᩆ <i>naka</i> → ᩃ᩶ᩆ <i>nanka</i> /naŋka/ or /nāka/
◌ိ	ꨀ᩵ᩁᩬᩅ᩠ᩉᩣᩴ <i>kusangisāti ling</i> ‘upper duplicator’	Indicates a geminated or otherwise double consonant	ᩃᩈ <i>pana</i> → ᩃ᩹ᩈ <i>panna</i>
◌ါ	ꨀ᩵ᩁᩬᩅ᩠ᩉᩣᩴ <i>raypāya</i> ‘stopper’	Glottal stop coda or glottalization of a consonant (not used in Ayeri)	ᩃᩇ <i>ta</i> → ᩃ᩼ <i>/taʔ/;</i> ᩃᩚ <i>sa</i> → ᩃ᩻ <i>/s’a/</i>

At times, it may be necessary to attach both a superscript diacritic and a vowel sign above a consonant. In this case, the consonant-modifying diacritic is placed first and the vowel diacritic on top of it—this is exactly equivalent to the rule exemplified for subscript diacritics in (9).

2.4 Numerals

Ayeri uses a duodecimal number system, that is, a system based on the powers of 12, which is a typological rarity.⁶ There is a digit for zero, so the system is positional, like the Hindu–Arabic digits used by the Latin alphabet. The numerals for the numbers from 1 to 12 are shown in Figure 2.10.

Figure 2.10: The numerals of Tahano Hikamu

1	2	3	4	5	6
12	𐄢	𐄣	𐄤	𐄥	𐄦
7	8	9	A	B	10
𐄧	𐄨	𐄩	𐄪	𐄫	𐄬

2.5 Punctuation and abbreviations

Tahano Hikamu’s system of manipulating the sound of syllables is very sophisticated, so it comes as no surprise that it is also host of a large number of punctuation marks. Figure 2.11 lists the ones commonly encountered, Figure 2.12 the ones not so commonly encountered.

• ⟨.⟩ does not look very much like a dot or a point, but it is derived from a sign that looks like two circles stacked on top of each other, similar to : ⟨-⟩ (see Figure 0.2). There is no mark for a comma as such, so : ⟨-⟩ or – ⟨-⟩ cannot be used in this way. Instead of a comma, a wide word space is used to separate syntactic units. A long dash – ⟨—⟩ is also sometimes found at the end of paragraphs or texts to mark their end. The strong exclamation mark ~ may appear in its exclamatory function at the end of a line, but does not necessarily indicate strong emphatic force in this case, but just an emphatic statement.

Regarding the less common marks, some of these seem like all to bland copies of modern punctuation, especially the brackets and the decimal point. Still, however, they may serve their purpose sometimes, and the brackets 𐄭𐄮 maybe come with the redeeming notion that they push off the text around the inclusion rather than encapsulating the inclusion within it, so the visual effect is slightly different. The name brackets 𐄯 are interesting and maybe useful insofar as many names in Ayeri are derived from common words, for example, 𐄰𐄱 *Ajān*, a male name, is literally ‘play, game’, relating to a playful character; 𐄲𐄳 *Migoray*, a female name, literally means ‘flower’. The name brackets, then, make it unmistakeably clear that a proper

⁶ And one possibly overrepresented by fictional languages due to its rarity in natural languages.

Figure 2.11: Common punctuation marks of Tahano Hikamu

	Native name	Function	Example
	၎် dan ‘dot’	Full stop	ဧကယျာ၎် Sarayāng. ‘He left.’
:	၎်၎် dan-dan ‘little dot’	A separator for small things, like clitics and abbreviations; divides the constituents of reduplication	ဧကယျာ၎် ada-nanga ‘this house’; ဧကယျာ ၎် pd ‘၎် hrs’; ၎်၎် dan-dan ‘dot-dot, little dot’
—	၎်ပု၎် puntān ‘dash’	General sign for a longer pause, equivalent to a dash, colon, semicolon, brackets	ယ၎်-ဧကယျာ Yan – saru! ‘Yan – go!’
၎်	၎်ကု၎် damprantan ‘question point’	Marks questions	ဧကယျာ၎် Manisu? ‘Hello?’
၎်	၎်ဧကယျာ dambahān ‘shouting point’	Marks exclamations; strong exclamations may be marked by the ၎် variant.	ဧကယျာ၎် Manisu! ‘Hello!'; ဧကယျာ Yi! ‘Urgh!’

Figure 2.12: Less common punctuation marks of Tahano Hikamu

	Native name	Function	Example
၎်	၎်ကု၎် danarān ‘speaking point’	Quotation marks	ဧကယျာ၎်ဧကယျာ Narayāng “Manisu!” ‘He says, “Hello!”’
၎်	၎်ကု၎် dankayvo ‘beside-point’	Bracketing of text	ဧကယျာ၎်ဧကယျာ babis (larau) ‘a (nice) day’
၎်	၎်ကု၎် dangaran ‘name-point’	Explicitly marks a name as such. For the closing name parenthesis, ၎် can be found as well.	ဧကယျာ၎်ဧကယျာ Ajān Savati; ဧကယျာ၎်ဧကယျာ Pila Lay Maran
၎်	၎်ကု၎် dansinday ‘number-point’	Marks (duo)decimal fractions	ဧကယျာ၎်ဧကယျာ 17.4၎်B82 ‘19.37482’
၎်	ဧကယျာ adrumaya ‘breaker’	Marks line breaks within a phrase	

Two very common abbreviations are symbolic in nature, like the ampersand & in the Latin alphabet, and incidentally, they correspond to it in that the very common small word *⁊* *nay* ‘and’ may be abbreviated as *⁊*. Based on this, its reduplicated form *⁊⁊* *naynay* ‘furthermore, also’ may be abbreviated as *⁊⁊*.

Over the course of the years since Tahano Hikamu's inception, I have liked to experiment with different styles of writing, that is, I tried applying a number of different writing styles to the script to change its look and feel while still staying true to the overall character shapes and the system behind the script. The example text I will be using to illustrate the different styles in the following is the first article of the United Nations *Universal declaration of human rights*:

[All human beings are born free and equal in dignity and rights. They are endowed with reason and conscience and should act towards each other in a spirit of brotherhood.] (United Nations 1948: Article 1)

Figure 2.13: Tahano Hikamu, ‘book style’

[illegible]

⁷ For examples, see Everson (2008), or *Wikipedia*.

subscript letters and in Ayeri, and the number of large swirling diacritics is also rather low, so there is still definitely a difference in appearance. The ‘angular’ style is also the one that is comparable in function to our bold face or italic style letters, since it is used in captions or to highlight special text within running text. This letter style (ဆိ၃၃ *binya* ‘angular’) is displayed in Figure 2.14.

Figure 2.14: Tahano Hikamu, ‘angular style’

The image shows two lines of handwritten text in the 'angular style'. The characters are bold and angular, with straight lines and sharp corners. The first line reads: 'က ကံလိၣ် နုၣ်ပုၣ်ဝဲၣ် ဖဲၣ်ကံၣ် နုၣ် နုၣ်ကံၣ်ကံၣ် နီၣ် နုၣ် နီၣ်။' The second line reads: 'ဝဲၣ် နီၣ်ကံၣ်ကံၣ် နီၣ်ကံၣ် နုၣ် ဝဲၣ်ကံၣ်ကံၣ် နုၣ် ဝဲၣ်ကံၣ် နုၣ် နီၣ်ကံၣ်ကံၣ် နီၣ်ကံၣ်။' The text is written in a dark ink on a light background.

The greatest difference to the ‘book’ style is that many of the main strokes double to become a thick and a parallel thin line and the shape of န <na> changes to have its swirl straightened into a simple descending line. The vowel carrier န changes to a flattened *O*-like circle, and the bottom curl in န <ta> changes to a wedge. While the right side of the န <sa> character in the ‘book style’ consists of two strokes—a flag and a downwards bow, both independently attached to the main stem—they connect here to form an *R*-like shape.

Neatly reproducing the shapes of either the ‘book’ style or the ‘angular’ style by hand goes rather slowly, so I was wondering what daily handwriting could look like. Of course, this presupposes pen and paper again; Salomon (1996: 377) mentions that inscriptions of Brāhmī and related scripts have been found on copper plates and plates made of other metals, besides stone. Metal plates can be inscribed with metal styluses and should allow similar shapes as modern pens. Wax tablets—a staple in European literacy until the use of paper became widespread—should as well allow for relative freedom of stroke direction. Figure 2.15 shows what Tahano Hikamu might look like quickly jotted down by hand.

Figure 2.15: Tahano Hikamu, ‘hand style’

The image shows two lines of handwritten text in the 'hand style'. The characters are simplified and more rounded than in the 'angular style'. The first line reads: 'က ကံလိၣ် နုၣ်ပုၣ်ဝဲၣ် နီၣ်ကံၣ် နုၣ် နုၣ်ကံၣ်ကံၣ် နီၣ် နုၣ် နီၣ်။' The second line reads: 'ဝဲၣ် နီၣ်ကံၣ်ကံၣ် နီၣ်ကံၣ် နုၣ် ဝဲၣ်ကံၣ်ကံၣ် နုၣ် ဝဲၣ်ကံၣ် နုၣ် နီၣ်ကံၣ်ကံၣ် နီၣ်ကံၣ်။' The text is written in a dark ink on a light background.

Many letter shapes become simplified, specifically န <ba>, န <ga>, န <ka>, န <na>, န <nga>, the vowel carrier န, and the vowel န <i>. Not shown here is the vowel length diacritic, န, which is simplified to a reverse *C* shape. The abbreviation န *na* ‘and’ is used throughout, though in a shape that is more similar to its ‘angular’ form န. န <na> is also taken from the ‘angular’ style န, which opens the possibility that

this is actually the basic shape rather than the ‘book’ style’s 𑄃, or both are different developments from a shared ancestor.

Most recently, I also wondered what Tahano Hikamu might look like if they were adapted to European blackletter style with its characteristic broken arches. This, of course, constitutes a sharp contrast to Ayeri’s usual look and feel, which made the experiment all the more interesting, though decidedly non-‘canonic’. Figure 2.16 shows what our example passage might have looked like at a time when Gothic book hands flourished.

Figure 2.16: Tahano Hikamu, ‘blackletter style’

The letter shapes from the ‘book’ style stay largely intact here, though all curves are broken up into at least two strokes, and strokes from the bottom left to the top right, which would push a quill in a way that causes ink to splatter, are avoided completely. The characters that differ most are 𑄃 (ga), 𑄃 (ra), 𑄃 (nga), and the vowel carrier 𑄃. 𑄃 (na) again appears in the ‘angular’ shape, though without its descender word-internally and in the abbreviation 𑄃 *nay*. 𑄃 (ta) comes with a horizontal stroke instead of a curl at the bottom; 𑄃 (sa) gains a descender, as does 𑄃 (ra). Not shown here either are changes to the ‘large’ diacritics.

3 Morphological typology

The first chapter dealt with the smallest constituent parts of words—speech sounds, which ones there are, and how they assemble into valid words. Consequentially, the following chapters will be about the next step up from this: morphemes, the atoms of meaning. First we will have a more general look at which kinds of morphemes there are, and then look at them more closely by part of speech. This chapter on morphological typology will first deal with general questions about Ayeri’s degree of synthesis, and then will try to answer questions about the kinds of processes the various morpheme classes carry out in the language.

3.1 Typology

For the largest part, Ayeri is an *agglutinative* language since it modifies word roots with affixes for the purposes of inflection and derivation, and these affixes, in the form of suffixes more specifically, can be stacked, especially on verbs; the average number of morphemes per word is thus greater than 1:

- (1) *Le kondasayāng hemaye pruyya nay napayya kayvay.*
Le kond-asa-yāng hema-ye-Ø pruy-ya nay napay-ya kayvay
PT.INAN eat-HAB=3SG.M.A egg-PL-TOP salt-LOC and pepper-LOC without
‘He always eats his eggs without salt and pepper.’

The verb root 𐌕𐌌: *kond-* ‘eat’ is inflected here for a habitual action with the suffix 𐌕𐌌𐌔𐌌 *-asa*, and also carries a person-inflection clitic, 𐌕𐌌𐌔𐌌 *-yāng*, marking a third person singular masculine agent. With the exception of person-inflection clitics, affixes tend to encode a single grammatical function. Verbs are not the only part of speech that can inflect; nouns and the relativizing conjunction can as well:

- (2) a. *Ang mətabanay tamanyeley yeyam.*
 Ang mə-tahan-ay.Ø taman-ye-ley yeyam.
 AT PST-write=ISG.TOP letter-PL-P.INAN 3SG.F.DAT
 ‘I wrote letters to her.’
- b. *Le turayāng taman sinā ang ningay tamala vās.*
 Le tura-yāng taman-Ø si-Ø-na ang ning=ay.Ø tamala vās
 PT.INAN send=3SG.M.A letter-TOP REL-PT.INAN-GEN AT tell=ISG.TOP yesterday 2SG.P
 ‘The letter which I told you about yesterday, he sent it.’

The principle of not conflating several grammatical functions into a single suffix can be observed in (2a) regarding the word *tamanyeley* ‘letters’, in which the plural marker *-ye* is distinct from the inanimate-patient case marker *-ley*. Strictly speaking, the pronoun *yeyam* ‘to her’ is also composed, namely of the third person feminine base form *ye* and the dative case marker *yam*. Example (2b) is one we have already encountered before (p. 13). Here, the relative pronoun, *sinā* ‘of/about which’ is inflected for genitive case, and stress on the usually unstressed last syllable suprasegmentally marks that this form is contracted from *sileyena* (*si-ley-ena*, REL-P.INAN-GEN).

So far, we have concentrated on suffixes, but there are a number of prefixes as well; (2a) exhibits the past prefix *mə-* (which is actually redundant in this case). There are also deictic prefixes on nouns, however. In the following example, the clitic *eda-* ‘this-’ joins the noun *peham* ‘carpet’ to indicate a specific carpet.

- (3) *Le no intoyyang eda-peham.*
 Le no int-oy-yang eda-peham-Ø
 PT.INAN want buy-NEG=ISG.A this=carpet-TOP
 ‘I do not want to buy this carpet.’

Besides prefixes and suffixes, Ayeri also possesses at least one grammatical morpheme of the kind Zwicky (1977) calls a ‘bound word’. These are cases where morphemes which are

always bound and always unaccented show considerable syntactic freedom, in the sense that they can be associated with words of a variety of morphosyntactic categories. Frequently, such a *bound word* is semantically associated with an entire constituent while being phonologically attached to one word of this constituent, and ordinarily the bound word is located at the very margins of the word, standing outside even inflectional affixes. (6)

This is the case with the marker *manga*, which is treated as an independent word, but can modify verbs and prepositions—heads of VPs and PPs, respectively—is unstressed and appears at the margin of its modification target:

- (4) a. *Ang manga yavaya ayon bariley.*
 Ang manga yava-ya ayon-Ø bari-ley
 AT PROG roast-3SG.M man-TOP meat-P.INAN
 ‘The man is roasting meat.’
- b. *Ya mətapyyāng maritay misley manga luga bari.*
 Ya mə-tapy-yāng maritay mis-ley manga luga bari-Ø
 LOCT PST-put=3SG.M.A before spit-P.INAN DYN between meat-TOP
 ‘The meat, he had put a spit through it before.’

In (4a), *ᄒᆞᆫ manga* modifies the verb *ᄒᆞᆫ yava-* ‘roast’ and indicates that this is a temporarily ongoing action, like the English progressive, except not as strongly grammaticalized.¹ In (4b), *ᄒᆞᆫ manga* modifies the preposition, on the other hand, to indicate that it is dynamic: *ᄒᆞᆫ luga* by itself means ‘among, between’, while its dynamic form *ᄒᆞᆫᄒᆞᆫ manga luga* means ‘through; during, while, for’.

As we have seen in the examples above, person suffixes on verbs are single morphemes that encode more than one property, for example *ᄒᆞᆫ -yeng* encodes the person features third person, feminine, singular, and agent. Personal pronouns, of which the person clitics on verbs are an instance, are the main case of fusion among agglutination in Ayeri, although some of the forms, like *ᄒᆞᆫ yeyam* ‘to her’ above, can be decomposed into root and suffix without problem.²

Perpendicular to the axis isolation–agglutination runs the axis analytic–synthetic. On the latter axis, Ayeri scores mostly as *synthetic*, since it prefers compactness over spreading a construction over several words, though it does not incorporate object NPs, so it is not going as far as being polysynthetic. It is nonetheless theoretically possible, due to suffixation being a prominent pattern, to form foot-long words like

- (5) *da-mətabasongoyyang-ikan*
 da=mə-taha-asa-ong-oy=yang=ikan
 such=PST-have-HAB-IRR-NEG=ISG.A=much
 ‘I would not much used to have had such’

¹ I suppose, a better parallel is the so-called *rheinische Verlaufsform* ‘Riparian progressive’ (*sein* ‘be’ + *am/beim* ‘at the’ + infinitive) in German, a construction common in the colloquial language which parallels the English progressive construction and is not yet fully grammaticalized (Eisenberg et al. 2016: 435). Speakers will thus accept both *Er lernt gerade*, literally ‘He studies right now’, and *Er ist am Lernen* ‘He is studying’.

² Originally, Ayeri’s personal pronouns were indeed agglutinative as well, so *ᄒᆞᆫ yeng* ‘she’ used to be *ᄒᆞᆫ iyeang* (*iy-e-ang*, 3SG-F-A). This also gives an explanation to Boga et al. (2016)’s observation that Ayeri’s plural pronouns are formed “[v]ielleicht sogar zu regelmäßiḡ” ([15]; ‘possibly in an even too regular way’).

Cases of analytic morphology are compound prepositions as we have seen one in (4b), but verbs as well show analytic structures not only with the progressive marker, but also with modals:

- (6) *Ming sahooyyang dabas.*
 Ming saha-oy-yang dabas
 can come-NEG=ISG.A today
 ‘I can’t come today.’

Most of the information the VP contains in this example is marked on the content verb, *saha-* ‘come’, except for ability, which is expressed by the particle *ming* ‘can’. *ming* is an uninflected form of the verb expressing ability and may be counted as an auxiliary verb in that the full semantic content of the VP is spread out over two verb forms, one major, one minor.³ Consider also the following example in which *ming* is inflected like a regular verb:

- (7) *Da-mingya ang Diyan.*
 Da-ming-ya ang Diyan.
 so=can-3SG.M A=Diyan
 ‘Diyan can (do it).’

3.2 Morphological processes

3.2.1 Prefixation

Prefixes in Ayeri apply mainly to verbs, but nouns, pronouns, adjectives and conjunctions can also appear with them, often in the form of proclitics. With verbs, ‘true’ prefixes—that is, morphemes that have been semantically bleached by grammaticalization to the point where they only express grammatical functions (Lehmann 2015: 157ff.) and which subcategorize words (Klavans 1985: 117)—are the tense prefixes marking both three degrees of past tense and three degrees of future tense, for example:

- (8) *Ang səsarāyn ya Makapetang.*
 Ang sə-sara-ayn.Ø ya=Makapetang
 AT FUT-go=IPL.TOP LOC=Makapetang
 ‘We will go to Makapetang.’

³ *ming* has, in fact, a verbal counterpart *manga-* ‘move; remove’ as well, which served as the origin of both the progressive and the dynamic marker.

Here, the prefix ḥ *sə-* marks future tense on the verb, ḥ *sara-* ‘go’. The other tense prefixes are ḥ *kə-* (NPST), ḥ *mə-* (PST), ḥ *və-* (RPST), and ḥ *pa-* (NFUT) and ḥ *ni-* (RFUT). Besides this set of prefixes, there are also a number of proclitics that can appear with verbs, though not exclusively. These are the anaphora ḥ *da-* ‘thus, so, such’ and the reflexive marker ḥ *sitang-* ‘self’:

- (9) *Da-mingya ang Diyan.*
 Da-ming-ya ang Diyan.
 so=can=3SG.M A=Diyan
 ‘Diyan can (do it).’

- (10) *Sitang-kecāng.*
 Sitang-ket-yāng
 self=wash=3SG.M.A
 ‘He washes himself.’

ḥ *sitang-* can also be used as a preverb in situations where the agent is also the instrument, so both of the following two sentences are equivalent in meaning:

- (11) a. *Sa apicāng nanga ikan sitang-yari.*
 Sa apit-yāng nanga ikan sitang-yari
 PT clean=3SG.A house complete self=3SG.M.INS
 ‘He cleaned the whole house by himself.’
 b. *Sa sitang-apicāng nanga ikan.*
 Sa sitang-apit-yāng nanga ikan
 PT self=clean=3SG.A house complete
 (idem)

Example (11a) shows the more common application of ḥ *sitang-*, that is, as a reflexive modifier of pronouns. The prefix ḥ *da-* can as well be used with noun phrases and is part of the demonstrative set of prefixes, ḥ *da-* ‘such’, ḥ *eda-* ‘this’, and ḥ *ada-* ‘that’:

- (12) *eda-ganang*
 eda-gan-ang
 this=child-A
 ‘this child’

The demonstrative prefixes are also used to form the demonstrative pronouns ḥ *edanya* ‘this one’, ḥ *adanya* ‘that one’ and ḥ *danya* ‘such one’. A special case in this regard is the postposition ḥ *da-nārya* ‘in spite of, despite’ where ḥ *da-* combines with the conjunction ḥ *nārya* ‘but, although, except’. There is also

a fixed adverbial expression using one of these prefixes, ᑭᑭᑦᑭᑦᑭᑦ *eda-tadayyam* ‘for the time being, for now’ (this=time-DAT).

Last but not least, the prefix ᑭᑭᑦ *ku-* ‘like, as though’ can be used with both adjectives and nouns (or, more precisely, phrases containing nominals):

- (13) a. *ku-koyaya*
 ku-koya-ya
 like=book-LOC
 ‘like in a book’
 b. *ku-prasi*
 like=sour
 ‘as though (it were) sour’

An example of a set-phrasal adverbial consisting of ᑭᑭᑦ *ku-* and a verb is ᑭᑭᑦᑭᑦᑭᑦ *ku-nasya* ‘as follows’, ᑭᑭᑦ *nasy-* meaning ‘follow’. What is curious here is that this fossilized form is lacking person marking and is just extended with an epenthetic *-a* since *-sy* is not a permissible coda. The expected form would be ᑭᑭᑦᑭᑦᑭᑦᑭᑦ **ku-nasyareng* (like=follow=3SG.INAN.A).

Following Klavans (1985), who suggests that clitics best be defined as “affixation at the phrasal level,” (Klavans 1985: 117) a very common kind of clitical prefix to the verb *phrase* are the topic markers. They are counted as parts of the VP but do not interact with it regarding stress assignment (they are always unstressed) while always being in an initial position, preceding any other preverbal elements:

- (14) a. *Ang tabanya tamanley.*
 Ang tahan-ya taman-ley
 AT write-3SG.M letter-P.INAN
 ‘He writes a letter.’
 b. *Ang mətabanya tamanley.* ‘He wrote a letter.’
 c. *Ang manga mətabanya tamanley.* ‘He was writing a letter.’
 d. *Ang manga no mətabanya tamanley.* ‘He was wanting to write a letter.’

3.2.2 Suffixation

As a largely agglutinative language, most grammatical marking in Ayeri is done by means of suffixes. These occur mainly with nouns and verbs, however, quantifiers take the shape of suffixes as well. Quantifiers, then, may modify content words almost regardless of their part of speech—noun, verb, adjective or adverb. The most pervasive examples of suffixation are certainly those of case marking on nouns and of person marking on verbs, for example:

- (15) *Sa pəbaruyang va manga miday tangya vana suyareri, vimyon!*
 Sa pə-haru-yang va.Ø manga miday tang-ya vana suyar-eri, vimyon
 PT NFUT-beat=1SG.A 2SG.TOP DYN around ears-LOC 2SG.GEN ladle-INS, monkey!
 ‘I’ll beat you around your ears with a ladle, you monkey!’

This example shows marking of *tang* ‘ears’ with the locative case suffix *-ya* and the marking of *suyar* ‘ladle’ with the instrumental case suffix *-eri*; the previous examples already provide instances of the exceedingly common markers for agent and patient case, *-ang* and *-as*, respectively. Besides case, nouns can also be marked for plural with the suffix *-ye*, and verb roots may be extended by the mood markers *-ong* (IRR), *-asa* (HAB) and *-oy* (NEG), the last of which should be the most frequently occurring. The mood suffixes can also be stacked, leading to the long word in (5) above. Person marking on verbs comes as agreement suffix or as a clitic personal pronoun depending on whether an agent NP proper is present or not for the verb to agree with; in (15), a cliticized agent pronoun *yāng* ‘he’ (3SG.M.A) appears.

As mentioned above, quantifiers appear as enclitics on almost any type of content word, like on the adverb *para* ‘fast’ in the following example:

- (16) *Tigalyeng para-ma.*
 Tigal-yeng para-ma
 swim=3SG.F.A fast=enough
 ‘She swims fast enough.’

3.2.3 Reduplication

There are two patterns of reduplication for verbs, one with complete reduplication of the imperative form to create a hortative statement (17a), and one with partial reduplication as a way to express that an action takes place again, that is, partial reduplication expresses a frequentative, as it were (17b). The imperative iterative, then, has a hortative function as well (17c):

- (17) a. *naru-naru*
 nara-u-nara-u
 speak-IMP~HORT
 ‘let us speak’
 b. *na-narayeng*
 na-nara-yeng
 ITER~speak=3SG.F.A
 ‘she speaks again’

- c. *na-naru*
na-nara-u
 ITER~speak-IMP
 'let us speak again'

With nouns, full reduplication is used to create a diminutive form (18a), though some reduplications are also lexicalized and may use roots from other parts of speech as well to form nouns, for instance, the words in (18b–d). There are also a number of adjectives for which there exists a lexical reduplication with an intensifying meaning; (19) lists a few examples. This, however, is not a productive derivation strategy.

- (18) a. *veney* 'dog' → *veney-veney* 'little dog, doggie'
 b. *gan* 'child' → *gan-gan* 'grandchild'
 c. *kusang* 'double (adj.)' → *kusang-kusang* 'model'
 d. *veh-* 'build' → *veha-veha* 'tinkering'
- (19) a. *apan* 'wide' → *apan-apan* 'extensive'
 b. *kebay* 'alone' → *kebay-kebay* 'all alone'
 c. *pisu* 'tired' → *pisu-pisu* 'exhausting'
