Set in Junicon and Fira Sans with Xe<sub>L</sub>TeX.

Ayeri is a fictional language spoken by fictional people in a fictional setting, and as such is not related to any naturally existing languages. It is thus not to be confused with *Azeri*, a Turkic language spoken in Azerbaijan and its surrounding countries. Ayeri's vocabulary is entirely *a priori*, this means, no real-world languages have been used specifically as sources of vocabulary. Ayeri is also not derived from any specific real-world language family by means of sound changes. Due to Ayeri's sound and spelling aesthetic being inspired by Austronesian languages, however, occasional overlaps with words existing in these may happen, but only accidentally so.

# Preface

---

This is my latest attempt to write a grammar of Ayeri, a fictional language which I have been developing since December 2003. Getting to work on grammar writing again was triggered by a growing dissatisfaction with not having a central place of documentation, when the first thing people look for on my website is often the grammar, incomplete as well as partially inaccurate and outdated as it may be. In addition to that, there was a seminar on fictional languages at the University of Tübingen, Germany, in the summer semester of 2016 (Buch 2016). Ayeri was one of the languages that was chosen for students to explore and evaluate.

The student group who worked on Ayeri came to the conclusion that its documentation is severely lacking in the description of basic elements and assumptions, since whole chapters of the grammar had been missing to date (Boga et al. 2016: 12).<sup>1</sup> This is to say that previous attempts of writing a full-fledged grammar of Ayeri have been incomplete due to loss of enthusiasm and creeping neglect.

Although the *Ayeri Grammar* has so far been lying dormant for five years, I have written a whole number of blog articles detailing various grammatical issues (Becker 2016a: Blog). These articles have been taken into consideration here. This grammar writing attempt is thus not only a transferral to a different typesetting system, but constitutes an extension to previous formal documentation as well.

I hope that by transferring my previous grammar writing from LibreOffice to L<sup>A</sup>T<sub>E</sub>X, combined with using GitHub as a version control system, maintaining and editing will become faster, more transparent, and more elegant, since L<sup>A</sup>T<sub>E</sub>X operates on plain text files, and version control helps in keeping track of changes over time.

Carsten Becker  
Marburg, July 18, 2016

<sup>1</sup>  *Kutānas-ikan* ‘thanks a lot’ to Bella Boga, Madita Breuninger, Thora Daneyko, and Martina Stama-Kirr for their hard work on making sense of my published materials in spite of information being scattered all over the place, as well as their providing me with the presentation concluding their group work.

## o Introduction

---

ကဝိဉ္စယမိမံဝေဒနာနိဗ္ဗိကာဓဿုဉ္စိယဟု မိမံကံ ခုဉ်းစီသန။  
*Paronaya adanyāng si ming tabanoyyāng, edareng voy kotanas.*  
‘He who cannot write believes it not to be toil.’  
— Anonymous<sup>1</sup>

In December 2003, the idea for a new fictional language was born, an idea that turned out to stick with me for over 10 years now.<sup>2</sup> At that time, my seventeen years old self was still fairly new to this whole making-up languages business, read things about linguistics here and there, and was not shy to ask questions about terminology (and, looking at old mails, a little impertinently teenager-like so), for example on the Conlang mailing list and the Zompist BBoard. One thing seemed to catch my interest especially: syntactic alignments other than the NOM/ACC of the few languages I was familiar with, that is, German, English, and French. Apparently this curiosity was big enough for me to grow bored with my second fictional language, Daléian (declared ‘quite complete’ after maybe half a year of work or so), and to start something new from scratch in order to put newly acquired knowledge to test.

I had read about “trigger languages” on Conlang-L and wanted to try my hands on making my own. I cannot remember how long it took me to come up with a first draft of an Ayeri grammar, however, I do remember having been told that a good language cannot be made in a summer. Of course, I still did not really know what I was doing then, even though I thought I had understood things and authoritatively declared “this is how it works” in my first grammar draft when things sometimes really do not work that way. But at least an interest had been whetted.

In order to illustrate the various stages from the beginnings to current Ayeri, I went through some old backups contemporary with the very early days. Here is a

<sup>1</sup> In the original Latin, *Quia qui nescit scribere putat hoc esse nullum laborem*. Scribe’s note in Berlin, State Library, Cod. Lat. fol. 270 (see Bluhme 1858: 589).

<sup>2</sup> Most of the text here is taken from the blog article, “Happy 10th anniversary, Ayeri!” (Becker 2013) with some slight rephrasings and extensions.

sentence from the oldest existing document related to it, titled “Draft of & Ideas for my 3rd Conlang”—the file’s last-changed date is December 14, 2003, though I remember having started work on Ayeri in early December. I added glossing for convenience and according to what I could reconstruct from the notes. This uses vocabulary and grammatical markers just made up on the spot and for illustrative purposes; little of it actually managed to make it into actual work on Ayeri:

- (1) *Ayevhoi      agiaemaesim      coyaielieđamavir      vhaieloyanaiye.*  
 ay-evhoi      agia-ema-esim      coyai-el-i-eđam-avir      vhai-el-o-yaŋa-iye  
 3SG.AN-SUBJ    read-VERB-SUBJ.AN    book-NOUN-AN-INDF-P    bed-NOUN-INAN-on-LOC  
 ‘He reads a book on the bed.’

According to the grammar draft of September 5, 2004, this would have already changed to:

- (2) *Ang      layaiyain      mecoyalei      ling      \*pinamea.*  
 ang      laya-iy-a-in      me-coya-lei      ling      \*pinam-ea  
 A.SUBJ    read-3SG.AN<sub>1</sub>-a<sub>1</sub>-SUBJ    INDF.INAN-book-P.INAN    top.of    bed-LOC  
 ‘He reads a book on the bed.’

A word for ‘bed’—*pinam*—was only (re-)introduced on October 24, 2008, however. In the current state of Ayeri, I would translate the sentence as follows:

- (3) *Ang      layaya      koyaley      ling      pinamya.*  
 ang      laya=ya.Ø      koya-ley      ling      pinam-ya  
 AT    read=3SG.M.TOP    book-P.INAN    top.of    bed-LOC  
 ‘He reads a book on a/the bed.’

As you can see, quite a bit of morphology got lost already early on, especially the overt part-of-speech marking (!) and animacy marking on nouns. Also, prepositions were just incorporated into a noun complex as suffixes apparently. Gender was originally only divided into animate and inanimate, but I changed that at some point because only being really familiar with European languages, it felt awkward to me not to be able to explicitly distinguish ‘he’, ‘she’, and ‘it’.

A feature that also got lost is the assignment of thematic vowels in personal pronouns to third-person referents: originally, every third-person referent newly introduced into discourse would be assigned one of /a e i o u/ to disambiguate, and there was even a morpheme to mark that the speaker wanted to dissolve the association. Constituent order was theoretically variable at first, but I preferred SVO/AVP due to familiarity with that. Later on, however, I settled on VSO/VAP. Also, I had no idea about what was called “trigger morphology” on Conlang-L for the longest time—essentially, this referred to the Austronesian, or Philippine,

alignment. I am not claiming that I know all about it now, just that due to reading up on the topic, I have a slightly more informed understanding now. Orthography changed as well over the years, so ⟨c⟩ in the early examples encodes the /k/ sound, not /tʃ/ as it does today; diphthongs were spelled as ⟨Vi⟩ instead of modern ⟨Vy⟩.

What was definitely beneficial for the development of Ayeri was the ever increasing amount of linguistics materials available online and my entering university (to study literature) in 2009, where I learned how to do research and also had a lot of interesting books available at the library.

One of the things people regularly compliment me on is Ayeri's script—note, however, that Tahano Hikamu was not the first one I came up with for Ayeri. Apparently, I had already been fascinated with the look of Javanese/Balinese writing early on;<sup>3</sup> Figure 0.1 shows a draft dated February 9, 2004. However, the letter shapes in this draft looked so confusingly alike that I could never memorize them. About a year later, I came up with the draft in Figure 0.2. What is titled “Another Experimental Script” there is what would later turn into Tahano Hikamu, Ayeri's ‘native’ script. According to the notes in my fictional language ring binder, the script looked much the same as today about a year from then, but things have only been mostly stable since about 2008.

An important date in the history of Ayeri was when I decided to set up an improved website for Ayeri that would include a blog. The idea was that this way, I could more freely write on whatever detail I currently interested me in Ayeri, outside of the constraints of the Grammar. Thus, *Benung. The Ayeri Language Resource* launched on March 1, 2011. Being able to write short articles, however, probably also led to neglecting work on the actual formal reference grammar, which had been lying dormant from January 2011 on. This was always on the premise that I would eventually include the information from blog articles in the grammar. However, juggling such a big document had always felt daunting, so I let laziness take the better part of me eventually as enthusiasm gradually subsided.<sup>4</sup> This renewed attempt at documentation has been started with the intention to right those wrongs.

I hope that by now it should be clear which kind of a fictional language Ayeri is: a personal, artistic language—or *artlang* in community parlance. Thus, my goal in creating Ayeri is not to propose yet another international auxiliary language, like Esperanto. It is also not my goal to make it as logical as possible, like Lojban. Neither is it my goal to engineer it towards certain underlying premises, for example,

<sup>3</sup> Compare, for instance, the charts in Kuipers and McDermott (1996). The Wikipedia articles on either script contain a number of images depicting the scripts in use, both current and historic.

<sup>4</sup> Let me add to my defense, however, that I also worked on my B. A. thesis in 2013 and my M. A. thesis in 2016, which required several months of preparation each and thus left me largely unable to work much on Ayeri.

Figure 0.1: First design for an Ayeri script (February 9, 2004)

to reach a maximal amount of information density, like Ithkuil, or to get by on as few different words as possible, like Toki Pona. It is also not a ‘what-if’ language in the sense of “What could the modern language of Old Irish speakers transplanted to Australia look like?” or “Latin piped through Athabaskan sound changes.”

Ayeri is rather an attempt to create an artificial language for personal enjoyment and intellectual stimulation by creating a feedback loop between reading up on linguistics and actively devising rules for a fictional language accordingly, to see how things work within the frame I created, or to try and see whether certain ideas work together at all when combined, and to better understand why they do or do not. Ayeri will only ever be as perfect as miniature models of things can be, since it has not grown organically from millenia of human interaction, and I cannot and will never know about each and every aspect of language myself, in spite of continued curiosity about these matters. Nor will it be possible for me to replicate all the fascinating twists and irregularities that natural languages normally entail. The ultimate goal in my work on Ayeri is, I suppose, to make it emulate natural languages to at least some degree of depth and complexity.

In writing this grammar, I hope that I will find a good balance between applying linguistic theory to already existing materials and ideas, and going forth to create rules for aspects of the language that have so far been neglected, often due to my

finally discusses how syntactic phrases are built up from words, eventually leading to the formation of complete sentences.

# 1 Phonology

---

This chapter will present charts depicting the phoneme inventory of Ayeri and describe the various commonly encountered allophones of both consonants and vowels. Following this, a detailed statistical analysis of the words found in a number of translated texts from 2008 to 2016 as well as dictionary entries up to July 2016 will produce insights into Ayeri’s phonotactics. Some notes on stress patterns and intonation will close the chapter.

## 1.1 Phoneme inventory

### 1.1.1 Consonants

At 17 consonants, Ayeri has a “moderately small” inventory, according to Maddieson (2013a). Table 1.1 shows the full chart of consonant phonemes.

Regarding allophony, /tj kj/ and /dj gj/ are usually realized as [tʃ] and [dʒ], respectively, except if a homorganic nasal /n/ or /ŋ/ is preceding: for instance, ႁႏႱ *ankyū* /ʼaŋkju/ ‘really’ is realized as [ʼaŋkju], not as \*[ʼaŋtʃu] or \*[ʼantʃu]. It is important to note, however, that besides this synchronic palatalization process leading to [tʃ] and [dʒ] as *allophones*, there is also a diachronic one in parallel here—or the diachronic process is still ongoing. For example, there is no way to predict whether ႁႏ *cuna* ‘original, initial’, ႏႱ *panca* ‘finally, eventually’, and ႏႱ *vac-* ‘like’, or ႏႱ *jaraŋ* ‘pilgrimage’, ႏႱ *aja-* ‘play’, and ႏႱ *nui-* ‘pour’ have /tj/ or /kj/, /dj/ or /gj/, respectively, unless we consider the clues given by the conservative native spellings of the respective words.<sup>1</sup> We can rather assume two sound changes, (1) tj, kj → tʃ, and (2) dj, gj → dʒ, leading to the *phonemes* /tʃ/ and /dʒ/ in the present-day language.

<sup>1</sup> Actual scribes would typically err in cases where the merger is complete, so this strategy would, in fact, be of limited use in the real world.

Table 1.1: Consonant inventory (divergent orthography in pointed brackets)

	Bilabial		Labiodental		Alveolar		Palatal		Velar		Glottal	
Plosive	p	b			t	d			k	g		
Affricate					tʃ <c>	dʒ <j>						
Nasal		m				n				ŋ <ng>		
Fricative				v	s							h
Tap/Flap						r						
Approximant						l		j <y>				

The plural marker ၵ -ye is commonly contracted to [dʒ] when a case suffix beginning with a vowel follows:<sup>2</sup>

- (1) a. ၵၵၵၵၵ nyānyang → nyānjang [ˈnjaːndʒaŋ] ‘persons’ (person-PL-A);  
 b. ၵၵၵၵ netuyas → netujas [neˈtudʒas] ‘brothers’ (brother-PL-P).

The plural marker may also contract before the locative marker ၵ -ya and the dative marker ၵ -yam, basically for dissimilation:<sup>3</sup>

- (2) a. ၵၵၵ nivayya → nivajya [niˈvadʒja] ‘at the eyes’ (eye-PL-LOC);  
 b. ၵၵၵ maviyeyam → mavijyam [maˈvidʒjam] ‘to the sheep’ (sheep-PL-DAT).

Dissimilation of the sequence ၵ -yaya is attested in my translation of Kafka’s short story “Eine kaiserliche Botschaft,” where the relative pronoun ၵ siyaya appears transcribed as *sijya*:

As far as morphophonology is concerned, the relative pronoun complex *sijya* ‘in/at/on which.LOC’ is interesting in so far as it is a contraction of \**siyaya* ‘REL-LOC-LOC’ that I introduced here [...] Since this feature does not occur in previous texts, let’s assume it’s an acceptable variant. (Becker 2012: 12)

The contraction happens “only if both parts are grammatical suffixes” (12), however, so the environments this contraction may appear in are effectively limited to relative pronouns combining locative and locative, or locative and dative marking.

The word ၵ lajāy ‘student’ is special in that it is the only word with ၵ [dʒa] so far. Presumably it is derived from the verb ၵ laya- ‘read’ with the agentive suffix ၵ -maya, except the shortening of the suffix—with or without compensatory lengthening of the final vowel of the modified word stem—was applied irregularly, possibly via \**layāya*. The regular form ၵ layamaya means ‘reader’.

Lastly, /h/ may assimilate to its phonemic environment and is realized as [ç] before front vowels, and as [x] before back vowels in this case:

- (3) a. ၵ tabi [ˈtaçi] ‘favorable’;  
 b. ၵ babo [ˈbaxo] ‘loud’.

While vowels become long when two identical vowels come into succession, consonants do not geminate but are treated like a single consonant:

<sup>2</sup> The customary romanization uses ⟨c⟩ and ⟨j⟩ for allophonic cases of [tʃ] and [dʒ] as well.

<sup>3</sup> ၵ -ea also occurs as an allomorph, so that ၵ -ye + ၵ -ea → ၵ -yēa.

Table 1.2: Vowel inventory (divergent orthography in pointed brackets)

	Front	Center	Back
High	i, i: ⟨ī⟩		u, u: ⟨ū⟩
Mid	e, e: ⟨ē⟩	ə ⟨ə, e⟩	o, o: ⟨ō⟩
Low		a, a: ⟨ā⟩	

- (4) a.  $\text{ṭavvāṅ}$  *tavvāṅ* [ta'va:ŋ] 'you get' (get=2SG.A),  
 b.  $\text{ḍisjan}$  *disjyang* [di'sjaŋ] 'I fasten' (fasten=1SG.A).

With diphthongs, the sequence /V<sub>1</sub>.j/ is treated as though it were /V<sub>2</sub>.j/, so the double /j/ simplifies to just a single /j/; however, the vowel remains lax in spite of being phonetically in an open position now:

- (5)  $\text{ṭipujja}$  *tipuyya* [ti'pu.ja] 'on the grass' (grass-LOC).

### 1.1.2 Vowels

Ayeri's vowel system distinguishes five qualities, as shown in Table 1.2; Maddieson (2013c) classifies this as "average." Length, however, is also a factor, and there are five diphthongs as well, as we will see below. At 17 : 5, the consonant–vowel ratio is 4.25, which Maddieson (2013b) again classifies as "average," although Ayeri finds itself at the upper end of the tier.

The lax vowels [ɪ ɛ ɔ ʊ] occur as allophones of their tense counterparts /i e o u/ in closed syllables, for example:

- (6) a.  $\text{ṁing}$  *ming* [mɪŋ] 'can, be able',  
 b.  $\text{ḍenja}$  *enya* ['ɛn.ja] 'everyone',  
 c.  $\text{ḍagon}$  *agon* ['a.gɔŋ] 'outer, foreign', and  
 d.  $\text{ṭakur}$  *pakur* ['pa.kʊr] 'ill, sick'.

/ə/ occurs marginally in the tense prefixes  $\text{ḍ}$ : *kə*- 'NPST',  $\text{ḍ}$ : *mə*- 'PST',  $\text{ṭ}$ : *və*- 'RPST', as well as in the prefix  $\text{ḍ}$ : *mə*- 'some, whichever'. Otherwise, [ə] acts as an allophone of /e/ in final unstressed position, for instance, in the word  $\text{ḍmine}$  *mine* ['minə] 'affair, matter, issue'.

Ayeri also possesses a number of diphthongs, these are: /ai ei ɔi ʊi au/, spelled ⟨ay⟩, ⟨ey⟩, ⟨oy⟩, ⟨uy⟩, and ⟨au⟩. Furthermore, there are long equivalents of the short vowels: /i: e: a: o: u:/; in romanization, long vowels are marked with a macron ⟨̄⟩ over the letter. Long vowels are lexicalized in a few words, for example:

- (7) a. ခဉ်း *nīsa* ‘wanted’, ကုန််း *pasīsa* ‘interesting’;  
 b. ခဉ်း *arēn* ‘anyway, however’, ကုန််း *lēra* ‘whore’;  
 c. ကုန််း *lā* ‘tongue’, ယုန််း *yāng* ‘he’ (he.A);  
 d. ခဉ်း *nōn* ‘will, intention’; and  
 e. ခဉ်း *babūan* ‘barbarian’.<sup>4</sup>

Otherwise, long vowels result from two same vowels next to each other, for instance:

- (8) ခဉ်း *aja-* ‘play’ + ခဉ်း *-an* ‘NMLZ’ → ခဉ်း *ajān* ‘game, play’.

Morphophonologically, long vowels also occur in double-marked relative pronouns where the agreement marker for the relative clause’s head has been omitted, for instance, ခဉ်း *sinā* ‘of which, about which’, as in the following example:

- (9) *Le turayāng taman sinā ang ningay tamala vās.*  
*le tura-yāng [taman-Ø]<sub>1</sub> si-Ø<sub>1</sub>-na ang ning=ay.Ø tamala vās*  
 PT.INAN send=3SG.M.A letter-TOP REL-PT.INAN-GEN AT tell=1SG.TOP yesterday 2SG.P

‘The letter which I told you about yesterday, he sent it.’

This is to disambiguate it from the plain genitive-marked relative pronoun ခဉ်း *sina* ‘which.GEN’:<sup>5</sup>

- (10) *tamanreng ledanena nā sina koronvāng*  
*taman-reng [ledan-ena nā]<sub>1</sub> si-na<sub>1</sub> koron=vāng*  
 letter-A.INAN friend-GEN 1SG.GEN REL-GEN know=2SG.A

‘the letter of my friend which you know’

As pointed out in (7c), the word ကုန််း *lā* ‘tongue’ ends in a long vowel, so the question is what happens when a case suffix beginning with a vowel is appended. To avoid a hiat, a glide /j/ may be inserted, so both of the following renditions are possible:

<sup>4</sup> I have gone years without dictionary entries for /u:/, but it has always seemed slightly odd to me to lack a vowel in that position when all other vowels can be long. Therefore, ခဉ်း *babūan* ‘barbarian’ and its adjective ခဉ်း *babū* ‘barbarian (adj.)’ were coined as ကုန််း *prankaye*—things ‘that you put in specifically to make things fit’, another new coining this decision resulted in.

<sup>5</sup> A variant which combines the allomorphs of the relativizer and the genitive case marker in the opposite way also exists: ခဉ်း *s-* + ခဉ်း *-ena* → ခဉ်း *sena*.

- (11) a. *Aku lāas!*  
           aka-u       lā-as  
           swallow-IMP tongue-P  
           ‘Shut up!’  
       b. *Aku lāyas!*  
           (idem)

With diphthongs—as described above—/ɪ/ coalesces with a following /j/ to /j/, but the initial vowel will not become tense, thus:

- (12) ၵိပုၼ် *tipuyya* [ti'pu.ja] ‘on the grass’ (grass-LOC).

Moreover, /u/ is commonly realized as [w] when followed by a vowel, for example in ၵုၼ်ကၢ *huākaya* ['wa:kaja] ‘frog’ or ရှိ: *rua-* [rwa] ‘have to, must’. [w] may also be an allophone of /uj/, as in ၼ်း *adauyi* [a'dawi] ‘then’, ၼ်း *edaui* [e'dawi] ‘now’, or ၼ်း *nekuyi* ['nekwi] ‘eyebrows’. The negative suffix ၼ်း *-oy* is also commonly contracted to [w] before a diphthong:

- (13) ၼ်းမိၼ် *mingoyay* → *minguay* [miŋ'wai] ‘I cannot’ (can-NEG=ISG.TOP).

## 1.2 Phonotactics

For the purpose of this statistical analysis, most of the available translations into Ayeri from late 2008 to July 2016 have been used as a text corpus;<sup>6</sup> example sentences from various blog articles have also been added, as well as dictionary entries for all nouns, adjectives, adverbs, pronouns, adpositions, conjunctions, and numerals if they were not prefixes or suffixes.<sup>7</sup> Borrowings have been deleted if they could not reasonably be words in Ayeri. Altogether, the corpus comprises 5,500 words, which

<sup>6</sup> These texts are: A Medieval Neighborhood Dispute (2015), A Message from the Emperor (2012), Article 1 of the Universal Declaration of Human Rights (2011), The Beginning of Tolstoy’s *Anna Karenina* (2014), Conlang Christmas Card Exchange 2008/09 (2009), Conlang Holiday Card Exchange 2010/11 (2011), Conlang Relay 15 (2008), Conlang Relay 17 (2010), Conlang Relay 18 (2011), The First Two Chapters from Saint-Exupéry’s *Le Petit Prince* (2013), The Four Candles (2010), Honey Everlasting (2014), LCC4 Relay (2011), The Lord’s Prayer (2015), The North Wind and the Sun (2016), The Origin of the Wind (2009), Ozymandias (2011), Please Call Stella ... (2008), Psalm 23 (2013), The Scientific Method (2014), The Sheep and the Horses (2012), Sugar Fairies (2011), The Upside-Down Ice Skater (2009). The texts can be accessed from Becker (2016a: Examples).

<sup>7</sup> This section updates and extends a previous analysis of the phonological makeup of dictionary entries (Becker 2010). The previous study had its focus on gathering frequency statistics for word generation, however, we want to know about words generally here.

is a very small figure for such a study, but there are only so many texts available unfortunately. Words may occur more than once.

Among the dictionary entries, verbs have notably been ignored, since verb stems alone do not constitute independent words—they are always inflected in some way, so that they may end in consonants or consonant clusters that independent words cannot end in. This also has repercussions on syllabification and stress, which depend on the inflection of the verb stem:

Table 1.3: Syllabification of inflected verbs

Suffix	<i>ca-</i> ‘love’	<i>gum-</i> ‘work’	<i>babr-</i> ‘mumble’
-ay (1SG)	<i>cáy</i>	<i>gu.máy</i>	<i>ba.bráy</i>
-va (2SG)	<i>cá.va</i>	<i>gúm.va</i>	<i>ba.brá.va</i>
-yam (PTCP)	<i>cá.yam</i>	<i>gúm.yam</i>	<i>bá.bryam</i>

For the purpose of gathering statistics on phonemes, the words from translated texts were converted to IPA first. Fortunately, this is rather easy as Ayeri’s romanization is very straightforward. Syllable breaks have also been inserted semi-automatically.

### 1.2.1 Number of syllables per word

First, let us see how many syllables words commonly have (see Table 1.4). The higher the syllable count, the more likely it is for them to be compounds or inflected words.

Two-syllable words make up the bulk of the sample, which is not surprising since 1,072 entries (55.43%) in the dictionary subsample are disyllabic: most of Ayeri’s roots are disyllabic. Unsurprisingly, most monosyllabic words are function words like the ones cited below. In the following, I will quote a few examples for each number of syllables per word:

- (14) a. ၼံၵ *ang* (AT),  
           ၵၵ *nay* ‘and’,  
           ၵၵ *rua* ‘must’;  
       b. ၼံၵ *datau* ‘normal’,  
           ၵၵ *nasay* ‘near to’;  
       c. ၼံၵၵၵ *avanyāng* ‘he sinks’ (sink=3SG.M.A),  
           ၵၵၵ *tovaley* ‘a cloak’ (cloak-P.INAN);  
       d. ၼံၵၵၵ *binyanveno* (corner.beautiful, a place name),  
           ၵၵၵ *mitanena* ‘of the palace’ (palace-GEN);

Table 1.4: Frequency of words with different numbers of syllables (n = 5500)

Segment	Count	Percentage
2 syllables	2277	41.40%
3 syllables	1393	25.33%
1 syllable	1201	21.84%
4 syllables	547	9.95%
5 syllables	74	1.35%
6 syllables	8	0.15%

- e. ဟယ်ပဗဲး *haruyamanas* ‘a beating’ (beat-PTCP-NMLZ-P),  
 နီနွံကဲးနီနွံ *sungkorankibas* ‘geography’ (science.map);
- f. ကယ်တမာယဲး *kaytomayanena* ‘of righteousness’ (righteous-NMLZ-GEN),  
 နီနွံမာယဲး *nasimayajang-ben* ‘all followers’ (follow-AGTZ-PL-A=all).

Table 1.5 shows the frequencies of syllable types by position in a word. It is important to note here that phonemes which consist of more than one segment—affricates, diphthongs, and long vowels—have been counted as only one of C (consonant) or V (vowel), respectively. The following subsections will elaborate on which sounds the Cs and Vs correspond to. Moreover, it is important to note that medial syllables have not been further distinguished by position in the word for the sake of this analysis, so anything between the second and the fifth medial syllable is treated the same. It would furthermore be possible to calculate the frequencies of one syllable type following the other, however, no such calculations have been carried out here.

In all positions, CV is the most common syllable type, followed by CVC. With a very big margin, V is the next most common syllable type, which is also most common in initial syllables and least common in monosyllabic words. The cases with only a few attestations are the following:

- (15) a. Initial CVCC:  
 လီကံး *linktang* /liŋk.'taŋ/ ‘they try’ (try=3PL.M.A),<sup>8</sup>  
 နီနွံကဲး *silvnang* /silv.'naŋ/ ‘we see’ (see=IPL.A);
- b. Final CCCV:  
 မီဂရီယို *migryo* /mi.grjo/ ‘flourishes’ (flourish-3SG.N),  
 နီနွံ *subryo* /su.brjo/ ‘ceases’ (cease-3SG.N);
- c. Single V:  
 အို *ay* /aɪ/ ‘I’ (1SG.TOP).

Table 1.5: Frequency of syllable types per word (n = 5500)

Type	Initial		Medial		Final		Single		Total	
CV	2896	67.36%	1974	72.02%	2109	49.06%	578	48.13%	7557	60.26%
CCV	55	1.28%	24	0.88%	46	1.07%	32	2.66%	157	1.25%
CCCV	—	—	—	—	2	0.05%	—	—	2	0.02%
CVC	761	17.70%	610	22.25%	1902	44.24%	298	24.81%	3571	28.48%
CCVC	29	0.67%	10	0.36%	85	1.98%	9	0.75%	133	1.06%
CVCC	2	0.05%	—	—	—	—	—	—	2	0.02%
V	488	11.35%	95	3.47%	67	1.56%	2	0.17%	652	5.20%
VC	68	1.58%	28	1.02%	88	2.05%	282	23.48%	466	3.72%
Total	4299	100.00%	2741	100.00%	4299	100.00%	1201	100.00%	12540	100.00%

The medial and final VC cases may seem like an oddity, but they are mostly due to the previous syllable ending in /ŋ/, with that syllable also containing a lax vowel, which means that this syllable must be closed. An alternative explanation would be to assume that /ŋ/ is ambisyllabic, or actually /n.g - ŋ.g/, but realized as [ŋ]. The high number of single-syllable VC is due to ልጥ ang ‘AT’, which alone appears 255 times in the sample (4.63% of all words, 21.23% of monosyllabic words, 90.43% of monosyllabic VC words).

### 1.2.2 Phonemic makeup of initial syllables

The statistics in the following sections have been gathered from the IPA conversions of translated texts and dictionary entries mentioned above. The transcribed words have been split into syllables and then the collected contents of each position group were written into separate plain text files, one each for:

- all initial syllables of polysyllabic words,
- all medial syllables of polysyllabic words,
- all final syllables of polysyllabic words, and
- all monosyllabic words.

Monosyllabic words are both initial and final syllables at the same time; they have been counted separately for the purpose of this analysis. Onsets, nuclei and codas have been matched by regular expressions; the command line tools `grep`, `sort`, and `uniq` were used to aggregate all occurring variants for each syllable segment as well as their absolute frequencies:<sup>9</sup>

(16) C = (?:tʃ|dʒ|[ptkbgdmnŋvʃhrljw])  
 V = (?:[ae]:?ɪ|əʊ|[ieaou]:?[ɪɛɔʊ])

As we have seen above (Table 1.5), CCV syllables only make up 1.28% of initial syllables, insofar it is no surprise that consonant clusters all appear at the bottom of Table 1.6. There also seem to be combination patterns in that initial clusters exist for all plosives plus /r/, and almost all bilabials plus /j/, with the exception of /bj/, however, /nj/ is added to the group instead. Combinations with /w/ only occur for /b/, /r/, and /s/, which do not share an obvious connection. Syllables without a consonant filling the onset position are marked with ‘Ø’; these numbers correspond to the VC and VCC rows in Table 1.5.

<sup>8</sup> The verb stem is found in the dictionary as ልጥ፡፡ *linka-*, with a final *-a*, and thus is possibly an entry changed at a later point, or the example from the text (Sugar Fairies) chosen here contains an error.

<sup>9</sup> However, `sort` was unable to handle all IPA characters, so `sed 'y/ɛɪɔʊ:fʒŋ/EIOU@:SZN/'` had to be used to compensate by transcribing everything into X-SAMPA.

Table 1.6: Frequency of onsets in initial syllables (n = 4299)

Phoneme	Frequency	Percentage
Ø	556	12.93 %
s	488	11.35 %
t	432	10.05 %
m	418	9.72 %
k	380	8.84 %
n	375	8.72 %
p	334	7.77 %
b	231	5.37 %
d	172	4.00 %
v	164	3.81 %
l	159	3.70 %
r	134	3.12 %
j	126	2.93 %
g	111	2.58 %
h	99	2.30 %
tʃ	30	0.70 %
pr	27	0.63 %
nj	27	0.63 %
kr	8	0.19 %
br	8	0.19 %
tr	6	0.14 %
dʒ	4	0.09 %
gr	3	0.07 %
w	2	0.05 %
sw	1	0.02 %
rw	1	0.02 %
pj	1	0.02 %
mj	1	0.02 %
bw	1	0.02 %

Table 1.7: Frequency of nuclei in initial syllables (n = 4299)

Phoneme	Frequency	Percentage
a	1847	42.96%
i	1011	23.52%
<i>i</i>	802	18.66%
<i>ɪ</i>	209	4.86%
e	705	16.40%
<i>e</i>	523	12.17%
<i>ɛ</i>	164	3.81%
<i>ə</i>	18	0.42%
u	260	6.05%
<i>u</i>	228	5.30%
<i>ʊ</i>	32	0.74%
o	227	5.28%
<i>o</i>	188	4.37%
<i>ɔ</i>	39	0.91%
a:	109	2.54%
aɪ	88	2.05%
eɪ	40	0.93%
e:	4	0.09%
ɔɪ	3	0.07%
ʊɪ	1	0.02%
o:	1	0.02%
i:	1	0.02%
e:ɪ	1	0.02%
aʊ	1	0.02%

Perhaps most striking about the nuclei of initial syllables presented in Table 1.7 is that plain vowels occur most frequently. As mentioned above, lax vowels are counted here as allophones of tense ones as their distribution is complementary and are listed here for the sake of completeness. This is the reason why the plain vowels are presented as grouped with their allophones in this table as well as in subsequent ones. Long vowels and diphthongs find themselves below the 5% threshold, and the words with single occurrences are:

- (17) a. ကွယ်နှံ *kuysān* ‘comparison’,  
 b. ဝဉ် *nōn* ‘will, intention’,  
 c. ဝဉ်န *nīsa* ‘wanted’,<sup>10</sup>  
 d. နှိယာယ *sēyraya* ‘will overcome’ (FUT-overcome-3SG.M),  
 e. နီဆံ *sautan* ‘cork’.

As the diphthong [e:i] only occurs due to allophony, it should not be counted as a phoneme for the purposes of this analysis. On the other hand, the same could be said for a lot of cases of [a:] included here—this caveat applies to all nouns derived from verbs ending in *-a* with the very common nominalizing suffix နှံ *-an*, as exemplified in (8) above. Similarly, the 18 instances of /ə/ reported here are mostly from tense prefixes also mentioned above, for instance, မသိသိ *məkoronay* ‘I knew’ (PST-know=1SG.TOP).

Initial-syllable codas (Table 1.8) are far less diverse than consonant onsets: there are only 10 attested segments in comparison to 28 for onsets (not counting empty codas of C(C)V syllables, which constitute the majority by a large margin), and the only two cluster attested are /ŋk/ in the word လိန်တန် *linktang* ‘they try’ (try=3PL.M.A), and /lv/ in the word လိပ်နာ *silvnang* ‘I see’ (see=1PL.A). There only being two incidences of a CC cluster is very probably an effect of the small sample size. Furthermore, the only unvoiced single coda consonants attested are /s/, /h/, /t/, /tʃ/ and /k/, the latter two only once, /h/ twice:

- (18) a. မေ့သိသိ *mehvāng* ‘you are supposed to’ (be.supposed.to=2SG.A),<sup>11</sup>  
 လိပ်နာ *robtang* ‘they bite’ (bite=3SG.M.A);  
 b. မိတ် *mutva* ‘you rub’ (rub=2SG.TOP),  
 ကလေး *patlay* ‘cousin’;  
 c. နီနီ *sik-sik* ‘tits’;  
 d. လိပ်နာ *vacvāng* ‘you like’ (like=2SG.A).

<sup>10</sup> ဝဉ်န *nīsa* and ဝဉ် *nōn* are both related to ဝဉ် *no-* ‘want, plan’.

<sup>11</sup> The dictionary entry for the verb is မှ *mya-*, so this may be an instance of my changing a word in the dictionary with the old one staying in the text (The Four Candles).

Table 1.8: Frequency of codas in initial syllables (n = 4299)

Phoneme	Frequency	Percentage
Ø	3441	80.04 %
n	298	6.93 %
ŋ	243	5.65 %
r	129	3.00 %
l	88	2.05 %
m	74	1.72 %
s	20	0.47 %
t	2	0.05 %
h	2	0.05 %
tʃ	1	0.02 %
ŋk	1	0.02 %
lv	1	0.02 %
k	1	0.02 %

### 1.2.3 Phonemic makeup of medial syllables

The onsets of medial syllables (Table 1.9) show properties very similar to those of initial syllables. The order of most common consonants may differ here—for example, the most common onset is /r/, not Ø or /s/—, but there are no restrictions on consonants to appear in this position, with the exception of /ŋ/ for reasons stated above (see section 1.2.1). Regarding initial clusters, there are further attestations for plosive plus /r/ (except for /kr/). As for clusters with /j/, the only one with a bilabial is /bj/, but the set is extended to /sj/ and /kj/. For clusters with /w/, only /sw/ and /kw/ occur here, while attestations for /bw/ and /rw/ as in initial-syllable onsets are lacking. This does not mean that those combinations are not principally possible in this position, however.

As with onset consonants, vowel nuclei of medial syllables (Table 1.10) do not show significant differences compared to those of initial syllables either. /a/ is more common here, and /o/ and /u/ switch places. Instead of /e:ɪ/, there is an attestation of /u:/ (see footnote 4), for which there is more reason to be counted as a phoneme than for /e:ɪ/. The sequences /i:/ and /uɪ/ also only occur once and twice, respectively, namely in the following words:

- (19) a.  *pasisa* ‘interesting’;  
 b.  *puluyley* ‘a mirror’ (mirror-P.INAN),  
 *tipuyya* ‘on the grass’ (grass-LOC).

i:	1	0.04%

The word in (19a),  $\text{పాసీ}$  *pasīsa* ‘interesting’, is rather transparently constitutes a causative derivation of the verb  $\text{పాసి}$  *pasy-* ‘wonder, be curious, be interested’, essentially meaning ‘making one wonder/curious’—the causative suffix  $\text{పాసి}$  *-isa* can as well be used to derive adjectives with a causative or resultative meaning. Nonetheless it should count as a lexeme in its own right, since it possesses idiomatic meaning.

With medial-syllable codas (Table 1.11) again, sonorants and /s/ make up the largest number of consonants in this position; /t/ and /g/ only occur once each in

- (20) a.  $\text{పాంగిటన్}$  *pangitlan* ‘money change’,<sup>12</sup> and  
 b.  $\text{తెలుగంట}$  *telugtong* ‘they survive’ (survive=3PL.N).

Table 1.11: Frequency of codas in medial syllables (n = 2741)

l	21	0.77 %
t	1	0.04 %
g	1	0.04 %

As documented in Table 1.5 above, Ayeri very strongly favors CV syllables in medial positions, hence the high count of zero segments here.

#### 1.2.4 Phonemic makeup of final syllables

The onsets of final syllables of polysyllabic words (Table 1.12) show the greatest amount of variety, which is due to Ayeri mostly using suffixes for grammatical purposes. Hence it is no surprise that combinations with /j/ and, indeed, /j/ itself as an onset, are especially common, since /j/ is also what a number of very common suffixes start with, for example the plural marker *-ye*, the locative marker *-ya*, the dative and participle marker *-yam*, as well as third-person animate pronoun agreement suffixes, and the various first-person and third-person animate pronominal clitics. Table 1.3 above shows exemplarily how verbs resyllabify when suffixes are attached. Even though single-segment onsets are strongly preferred, Cr, Cw, and especially C(C)j seem to be generally permissible.<sup>13</sup>

<sup>12</sup> The word for ‘money’ is *pangis*, so (20a) is probably a compound, albeit not a fully transparent one. The word for ‘change’ is *tila-*, and there seems to be a nominalizing *-an*. Ayeri allows noun–verb compounds to have a nominalized verb in the second position in spite of it being the head—noun–noun compounds mostly come in head-initial order. Possibly, what happened at the morpheme borders is that *tilān* underwent metathesis to *\*itlān* to match the rhyme of *pangis*. *\*pangisitlān* then underwent irregular haplology (and shortening of the nominalizing suffix) to *pangitlan*.

<sup>13</sup> The sequence /sj/ poses difficulty here as there are examples for /Vs.jV/ as well as for /V.sjV/, and I cannot tell for sure if there is a strict rule in operation. It seems that /V.sjV/ is more likely to occur when the second syllable is stressed, whereas /Vs.jV/ is more likely to occur when the first syllable is stressed. Ayeri’s own Tahano Hikamu orthography would not show the difference either, since /sja/ is spelled *ꞑ* either way, and there is no heeding morpheme

Table 1.12: Frequency of onsets in final syllables (n = 4299)

w	9	0.21%			

Nuclei of final syllables (Table 1.13) do not bear striking differences to nuclei in other positions. /a:/ comes out second here due to the common nominalizer *-an*, which lengthens the vowel of verb stems ending in /a/, as demonstrated in (8). /aɪ/ is also fairly common here as it is the topic-marked first-person pronoun/pronominal clitic; for the same reason, /a:ɪ/ occurs a number of times—the vowel-lengthening rule applies here as well, so its status as a phoneme is marginal. All instances of /e:/ in the sample are from the word *arēn* ‘anyway, however’; all evidence for /i:/ is from *sirī* ‘due to which’ (see section 1.1.2). The only evidence for /u:/ in the sample is from *babū* ‘barbarian (adj.)’.

breaks in placing the diacritic. /CsjV/ will be /C.sjV/ in any case, since Ayeri avoids final consonant clusters if possible, see Table 1.5.

Table 1.13: Frequency of nuclei in final syllables (n = 4299)

r	21	0.49 %
k	1	0.02 %

The list of coda consonants in final syllables (Table 1.14) is very slightly more restrictive than even that of coda consonants in medial syllables (see Table 1.11), since the only non-sonorant attested is /k/, which only occurs in *ṣik-ṣik* ‘tits’ again, which—besides being a vulgar term, thus maybe slightly more dispositioned to allow for deviating phonotactics—looks quite like onomatopoeia, possibly for the sound of sucking.<sup>14</sup>

### 1.2.5 Phonemic makeup of single syllables

Onsets of single syllables (Table 1.15) appear to be the least varied category. Still, none of the basic set of consonant morphemes (see Table 1.1) is missing—the frequency order is just completely different from the other onsets surveyed, not merely a mixture of initial and final syllables. Consonant clusters with /j/, /w/ and /r/ exist here as well. Combinations with /j/ are only present for /m/ and /n/, while /r/ again combines with plosives; /w/ combines with /n/ and /r/ at least, which we have already seen in final-syllable onsets (see Table 1.12). Whereas /mj/ has only occurred once in initial-syllable onsets so far (see Table 1.6), it occurs a few more times here, all in the word *ṣmya* ‘be supposed to’, which is very commonly used as an unconjugatable modal particle.

A consonant onset that can only be found in monosyllables is /ŋ/,<sup>15</sup> in *ṣngas* ‘almost’, a quantifier suffix that has managed to sneak in due to being marked as an adverb in the dictionary, since it can modify a verb:

<sup>14</sup> Kroonen (2013: 489–490) identifies PGmc *\*sūgan-*, *\*sūkan-* ‘to suck’ as an iterative of PGmc *\*sukkon-*, *\*sugōn-* ‘to suck’ and reconstructs PIE *\*souk-neh<sub>2</sub>-*. However, he does not say anything about the Germanic word being onomatopoeic in origin.

<sup>15</sup> At least according to the analysis chosen here, see section 1.2.1 for an explanation.

Table 1.15: Frequency of onsets in single syllables (n = 1201)

Phoneme	Frequency	Percentage
Ø	284	23.65%

pr	5	0.42%
dʒ	3	0.25%
tr	2	0.17%
nw	1	0.08%
ŋ	1	0.08%
kr	1	0.08%
br	1	0.08%

- (21) *Apayeng-ngas.*  
 apa=yeng=ngas  
 laugh=3SG.F.A=almost  
 ‘She almost laughed.’

Here, ၵာန *-ngas* modifies the verb complex like any other adverb:

- (22) *Apayeng baho.*  
 apa=yeng baho  
 laugh=3SG.F.A loudly  
 ‘She laughs loudly.’

However, whereas ခပ် *baho* ‘loud’ is treated as a separate unit in terms of intonation, ၵာန *-ngas* is unstressed and binds to what it follows:

- (23) a. ၵာန-ၵာန ၵာန *Apayeng-ngas.* [apa'jɛŋas];  
 b. ၵာန-ၵာန ခပ် *Apayeng baho.* [apa'jɛŋ 'baxo].

As with onset consonants of monosyllabic words, nuclei of this syllable type are the least diverse group again (Table 1.16). One segment that is notably absent is /au/, and the marginally phonemic /e:/ is not present either. By having /a/, /ai/, /a:/ at the top, monosyllabic words behave similar to final syllables of polysyllabic words (see Table 1.13), however, the order of the most common vowels bears more similarities to that of initial and medial syllables (see Tables 1.7 and 1.10). The very uncommon /o:/ features twice in this group, namely in two instances of the word ခပ် *nōn* ‘will, intention’.<sup>16</sup>

Like the other syllable segments of monosyllabic words, coda consonants (Table 1.17) as well show the lowest degree of variety among all the coda consonants of the various syllable classes discussed so far. The order is basically the same as that of final-syllable codas (see Table 1.14), though /ŋ/ supersedes /n/ and there is some attestation of final /h/. As noted above, the prevalence of /ŋ/ is due to the agent-topic marker ၵာ *ang* (see section 1.2.1). /h/ only occurs in the interjections ခပ် *ah!* and ခပ် *āh!*, so its status as an actual phoneme in this position is marginal at best.

<sup>16</sup> Ayeri used to have ခပ် *-on* as a nominalizer beside ခပ် *-an*, however, it was not very productive and has long fallen out of use. ခပ် *nōn* is thus, in fact, originally a nominalization of ခပ် *no-* ‘want, plan’.

Table 1.16: Frequency of nuclei in single syllables (n = 1201)

Table 1.18: Frequency of cross-syllable consonant clusters (n = 1270)

Interval [%]	Consonant cluster
0.00 ... 0.09	g.t, h.t, h.v, k.s, l.n, lv.n, m.bj, m.d, m.dʒ, m.l, m.n, m.pr, m.r, n.dv, n.g, <sup>17</sup> n.h, n.w, ŋ.dʒj, ŋ.kw, ŋ.m, ŋ.n, ŋ.rj, ŋ.t, ŋk.t, r.b, r.dʒ, r.g, r.l, r.m, r.sj, r.tʃ, r.v, s.dʒ, s.h, s.l, s.n, s.p, s.v, t.v, tʃ.v (0.08%).
0.10 ... 0.24	l.bj, m.br, m.t, n.s, ŋ.b, ŋ.h, ŋ.p, ŋ.w, r.dʒj, r.pj, s.dʒj, s.m, t.l (0.16%); l.dʒ, l.p, m.k, n.sj, ŋ.dʒ, ŋ.g, ŋ.s, r.pr (0.24%).
0.25 ... 0.49	m.v, r.s, s.r (0.31%); n.r, s.t (0.39%); m.pj, n.dʒj, r.d (0.47%).
0.50 ... 0.74	ŋ.kj, ŋ.v, r.k, r.n (0.55%); l.b, l.t, ŋ.r (0.71%).
0.75 ... 1.00	r.p, r.t (0.87%); l.vj (0.94%).
1.0 ... 2.4	m.j (1.18%); ŋ.l (1.34%); n.tʃ (1.50%); n.dʒ (2.13%); n.v (2.28%); l.j (2.36%).
2.5 ... 4.9	m.p (2.52%); s.j (2.60%); n.l (2.91%); l.v (3.15%); m.b (3.23%); ŋ.k (3.78%).
5 ... 9	n.t (5.28%); n.d (6.85%); ŋ.j (7.32%); r.j (8.98%).
10+	n.j (25.35%).

### 1.2.6 Cross-syllable consonant clusters

Since a table detailing every combination with its absolute and relative frequency would be too large here, Table 1.18 gives the attested combinations ordered by brackets. As can be expected, bilabials cluster mostly with bilabials (83/112 purely bilabial CC combinations = 74.11%), alveolars with alveolars (317/948 = 33.44%), and velars with velars (59/207 = 28.51%). However, at least for alveolars and velars, the score is even higher with /j/: 52.64% and 44.93%, respectively. /j/ is also the most common second consonant overall, at 47.8% of all consonant clusters; /n.j/ is the most common cluster at a total of 25.35%. Alveolars provide the highest variety of both first and second consonants, with 6 different phonemes making up 74.65% of C<sub>1</sub>, and 8 different phonemes making up 28.74% of C<sub>2</sub>.

Labiodentals and glottals occur least frequently, on the other hand: There is only one cluster with /v/ as a first consonant, namely, /lv.n/ (0.08%). For /h/, there are two, which are /h.v/ and /h.t/ (0.16%). Altogether, however, there are 97 combinations in /v/ (7.64%)—most commonly /l.v/ (3.15%) and /n.v/ (2.28%)—while there are only 4 in /h/ (0.31%): /n.h/, /s.h/, and twice /ŋ.h/.

<sup>17</sup> This is from གཙུག་གཙུག་ *gan-gan* ‘grandchild’ being given as /gan.gan/ in the dictionary, which is the intended pronunciation, however. Assimilation to [ŋ] does not operate in this case.

At 924 first consonants (72.76%), the nasals /m/, /n/, and /ŋ/ make up the largest group going by manner of articulation, followed by the tap /r/, which appears 175 times (13.78%) as the first consonant. For second consonants, approximants constitute the largest group at 669 combinations (52.68%), followed by 387 pairs with plosives second (30.47%).

## 1.3 Notes on prosody

### 1.3.1 Stress

Ayeri uses dynamic accent, that is, stress is based on differences in the loudness of syllables, among others.<sup>18</sup> Which syllable is stressed depends on a mixture of which position in a word a syllable occupies and the phonemic shape of it. In fact, English, which also has phonemic stress in pairs such as *record* /'rɛkərd/ (noun) and /rɪ'kɔrd/ (verb) that Ayeri lacks, does a similar thing (examples adapted from Halle 1998: 552):

- (24) *admire* /æd'maɪər/ — *admirable* /'ædmərəbl/ [English]  
*carnivore* /'karnɪvɔr/ — *carnivorous* /kar'nɪvərəs/  
*ignore* /ɪg'nɔr/ — *ignorant* /'ɪgnərənt/

Stress does not stay at fixed intervals in these words and they even change their sound structure a little, but there are a number of variables which can nonetheless be formally described and applied here (Halle 1998: 564–565).<sup>19</sup> To demonstrate how word stress moves around in Ayeri, the complete declension paradigm for *ṣ̣ṣ̣ niva* ‘eye’ is presented in Table 1.19.

It may appear that in the table above, stress is always on the penultimate syllable, which is indeed the case for most forms quoted there, but compare the superficially unmarked form *ṣ̣ṣ̣ niva*, which is disyllabic with stress on the first (= penultimate) syllable, to the agent and patient singular forms, *ṣ̣ṣ̣ṣ̣ nīvāṅ* and *ṣ̣ṣ̣ṣ̣ nīvās*, respectively. These are also disyllabic, however, they are stressed on the second (= ultimate) syllable. Similarly, compare the agent and patient plural forms to each other: the agent plural form *ṣ̣ṣ̣ṣ̣ṣ̣ nivajang* is trisyllabic and has its main

<sup>18</sup> For a discussion of terms, see Kager (2007), for instance.

<sup>19</sup> Halle (1998) takes a generativist approach rather than a more modern Optimality-Theory based one like Kager (2007) does, who only deals with fixed-stress systems in this introductory article, though Halle’s article is still informative. Simplifying a lot, English essentially tries to construct trochaic feet from the right edge of the word. If the last syllable’s vowel is not light, it is skipped and stress moves to the antepenultimate syllable; this process is recursive for words with multiple feet, although some suffixes introduce irregularities in rule application.

<sup>20</sup> Final-syllable stress is possible as well, also in the plural.

Table 1.19: Declension paradigm for Ayeri ຂໍ້ *niva* ‘eye’

	Singular		Plural	
TOP	<i>ní.va</i>	‘the eye’	<i>ni.vá.ye</i>	‘the eyes’
A	<i>ni.vǎ́ng</i>	‘eye’	<i>ni.va.jǎ́ng</i>	‘eyes’
P	<i>ni.vǎ́s</i>	‘eye’	<i>ni.vá.jas</i>	‘eyes’
DAT	<i>ni.vá.yam</i> <sup>20</sup>	‘to the eye’	<i>ni.vá.jyam</i>	‘to the eyes’
GEN	<i>ni.vá.na</i>	‘of the eye’	<i>ni.va.yé.na</i>	‘of the eyes’
LOC	<i>ni.vá.ya</i>	‘at the eye’	<i>ni.vá.jya</i>	‘at the eyes’
CAUS	<i>ni.va.í.sa</i>	‘due to the eye’	<i>ni.va.jí.sa</i>	‘due to the eyes’
INS	<i>ni.vá.ri</i>	‘with the eye’	<i>ni.va.yé.ri</i>	‘with the eyes’

stress on the third (= ultimate) syllable, while the equally trisyllabic patient plural form ຂໍ້ຖີ *nivajas* is stressed on the second (= penultimate) syllable again.

It should have become clear that even though the basic form ຂໍ້ *niva* has first-syllable stress, *ni* will not necessarily carry stress across the whole paradigm. It should also have become clear that the basic algorithm to determine stressed syllables in Ayeri has something to do with counting syllables from the right edge of a word, although some complications need to be factored in. The following sections will try to describe these formally.

#### Analysis of stress patterns in disyllabic words

The basic foot in Ayeri is a trochee, and for the most part it does not matter whether the syllable is open or closed, or whether there are complex onsets or codas, or no onsets or codas at all:<sup>21</sup>

- (25) a.     $\acute{x}$          $x$   
           *ha* - *ri* ‘pithy, striking’
- b.     $\acute{x}$          $x$   
           *sa*    - *yan* ‘hole, cave’  
           *sem* - *ba* ‘comb’
- c.     $\acute{x}$          $x$   
           *bri* - *ha* ‘grace’  
           *ba* - *brya* ‘(he) mumbles’  
           *a*    - *gu* ‘chicken’

<sup>21</sup> In the following, a syllable will be marked by  $\langle x \rangle$  and receives an acute accent ( $\acute{\phantom{x}}$ ) when carrying primary stress, a grave accent ( $\grave{\phantom{x}}$ ) when carrying secondary stress, and no accent when unstressed. Feet are marked by horizontal lines ( $\langle \rangle$ ).

It can be deduced from words with more than two syllables that stress assignment is trochaic. Stress assignment furthermore runs from right to left, so that in a word with more than two syllables, the last two syllables form a full foot:

- (26) a.    x    |     $\acute{x}$     x  
           *ba* - *ba* - *lan* 'target, goal'  
           *jar* - *ma* - *ya* 'pilgrim'
- b.     $\acute{x}$     x    |     $\acute{x}$     x  
           *bo* - *ra* - *ma* - *ya* 'sinner'  
           *ya* - *ma* - *na* - *ti* 'causer'

In the case of (26b), the stressed syllables of the first foot bear secondary stress while those of the second foot bear primary stress. Complications, then, come in the form of syllables ending in /ŋ/, containing a long vowel, or containing a diphthong, or a combination of those features. Ayeri does not have syllables that contain a diphthong and also end in /ŋ/, though, since consonant codas after a diphthong are largely avoided.<sup>22</sup> Since the presence or the absence of a certain element that is suspected to have an effect on stress assignment is a yes–no decision, we can make a matrix of binary features:

Table 1.20: Types of heavy syllables

	[+ DIPH, – ŋ]	[– DIPH, + ŋ]	[– DIPH, – ŋ]
[+ LONG]	++	++	++
[– LONG]	+	+	–

The feature matrix above (Table 1.20) shows the various kinds of syllable types that we will now see have a manipulative effect on trochaic stress assignment. These syllable types can be considered 'heavy' in that they attract stress and thus modify the regular assignment of stress to every other syllable from the right edge of a word. For the time being, we will only test their effects on disyllabic words as the most common type. As will be shown in the following example, heavy syllables in ultimate positions attract stress while quasi-regular results are produced when they are in penultimate position and the ultimate syllable is not heavy:

- (27) a.    x         $\acute{x}$   
           *ma* - *tay* 'summer, wet season'  
           *pa* - *dang* 'mind; heart, mood'  
           *ka* - *nāy* 'I marry' (marry=1SG.TOP)  
           *bra* - *syāng* 'he bathes' (bathe=3SG.M.A)  
           *na* - *rān* 'word; speech'

<sup>22</sup> It might thus be possible to alternatively analyze diphthongs in /ɪ/ as /Vj/ sequences, essentially.

- Unfortunately, there are no disyllabic examples for the feature sets [+LONG, -DIPH, +η] and [+LONG, +DIPH, -η] in the first syllable (syllables of the type /C(C(j))V:η/ or /C(C(j))Vɪη/). If there were, they would group with (27b).

(28) a. x            x̣  
          bay - hāy    ‘I govern’ (govern=ISG.TOP)  
          say - lyāng   ‘he sails’ (sail=3SG.M.A)  
          kay - vān     ‘container’

      b. x            x̣  
          kong - āyn    ‘we enter’ (enter=IPL.TOP)  
          keng - vāng   ‘you notice’ (notice=2SG.A)  
          lang - -vā     ‘in the most tiresome way’ (tiresome=SUPL)

We can see here that these words have primary stress invariably on the last/long syllable in spite of a heavy syllable preceding in the examples in (28b). The question then is, however, what happens if we invert this order. This is more problematic than it sounds, however, as initial [+LONG, +DIPH, -η] and [+LONG, -DIPH, +η], as well as final [-LONG, +DIPH, +η] do not occur, thus, there will only be one possible combination here—the reverse pattern of  $\text{ḥaṭṭa}$  or *lang-vā* ‘in the most tiresome way’ from (28b) above, also compare with (27):

- There is only one pattern possible here, which is very little to make a point, however, other words following this syllable pattern, like  $\text{ႬႬႬ}$  *nāreng* ‘rather’, for example, behave in the same way. A long syllable has precedence over other kinds of heavy syllables, so  $\text{ႬႬ}$  *-nang* does not take away stress from  $\text{ႬႬ}$  *cā-* as one might expect from the examples in (27a). Another question is what happens if we pit

elements from the  $[\pm \text{LONG}]$  rows against another feature combination of the same row. As above, we will start with the  $[-\text{LONG}]$  row:

- (30) a.     $\text{x}$          $\acute{\text{x}}$   
           *bay - tang* ‘blood’  
       b.     $\text{x}$          $\acute{\text{x}}$   
           *pang - lay* ‘goddess’

In the case of examples for  $[\text{+LONG}]$  pattern combinations, we need to keep in mind again that initial  $[\text{+LONG}, \text{+DIPH}, -\eta]$  and  $[\text{+LONG}, -\text{DIPH}, \text{+}\eta]$  are not attested, so again, there will only be one possible combination of two syllables with a long vowel:

- (31)     $\acute{\text{x}}$          $\acute{\text{x}}$   
           *mā - sāy* ‘I traveled’ (PST-travel=ISG.TOP)

Combining two long syllables with each other will result in both being stressed, which is otherwise avoided in Ayeri, as we will see later. Moreover, the following patterns emerge if we combine each pattern with itself; the combinatorial restrictions mentioned above apply again, of course:

- (32) a.     $\text{x}$          $\acute{\text{x}}$   
           *kay - vay* ‘without’  
           *dang - reng* ‘bell’ (bell-A.INAN)  
       b.     $\acute{\text{x}}$          $\acute{\text{x}}$   
           *bā - mā* ‘parents, mom-and-dad’

As demonstrated in (28), the last heavy syllable will receive primary stress, except if two long syllables collide, in which case the first long syllable will receive secondary stress.

To summarize the above findings:

1. Ayeri assigns trochaic stress from the right edge of a word. A foot thus consists of two syllables, of which the first is stressed.
2. Syllables ending in  $/\eta/$  or ones containing a diphthong are considered heavy. They attract stress and take it away from a preceding stressed syllable if the following syllable is not stressed already.
3. Syllables containing a long vowel are considered superheavy and override both light and heavy syllables in attracting stress, since long vowels cannot be unstressed.

Table 1.21: Stress patterns for [+ HEAVY, – LONG] in trisyllabic words

–H –H +H	<i>prantanley</i>	x   x ́	‘question’ (question–P.INAN)
–H +H –H	<i>sarayya</i>	x   ́ x	‘(he) bows’ (bow–3SG.M)
+H –H –H	<i>taykondam</i>	x   ́ x	‘break (n.)’
–H +H +H	<i>ralanghay</i>	x   x ́	‘thumbnail’
+H –H +H	<i>kaybunay</i>	́ x   x ́	‘by the way’
+H +H –H	<i>maykongas</i>	x   ́ x	‘harbor’ (harbor–P)
+H +H +H	<i>saylingyang</i>	́ x   x ́	‘I progress’ (progress=1SG.A)

4. Primary stress is assigned to the last stressable syllable, or otherwise the last heavy syllable. In the rare case of two long/superheavy syllables after another, the first syllable receives secondary stress and reduces in duration.

As we will see in the in the next section, however, another rule needs to be added to this set:

5. Secondary stress is assigned to syllables that are eligible for word stress but which are not in the final foot.

#### Analysis of stress patterns in trisyllabic words

So far, we have only considered all the possible combinations of two heavy and light syllables. Doing the same for all combinations of three and more syllables would be possible, though the list of examples were to become even longer. Since the feature pair [ $\pm$  DIPH,  $\pm$   $\eta$ ] behaves the same way throughout and both features are in complementary distribution, we need not test iterations of them separately, but can subsume them under the label [ $\pm$  HEAVY]. The parameters that need testing, then, are [ $\pm$  HEAVY] in combination with [ $\pm$  LONG]. There are 4 possible outcomes for these two features, which in the case of three syllables leads us to  $(2 \times 2)^3 = 64$  theoretically possible combinations. For this reason, I want to point out just a few cases, since the general rules sketched out above still apply.

First, let us look at [+ HEAVY, – LONG] combined with [– HEAVY, – LONG] in all positions (Table 1.21). Finding words that fit the respective permutations is not too much of a problem, especially in cases where there is only one heavy syllable. It becomes clear from Table 1.21 that the rules stated at the end of the previous section (p. 35) also hold in the case of trisyllabic words whose syllables alternate short syllables based on the [ $\pm$  HEAVY] feature: ကုဉ်ဒ်ဒ် *prantanley*, ကုဉ်ဒ်ဒ် *ralanghay*, ကုဉ်ဒ်ဒ် *kaybunay*, and ကုဉ်ဒ်ဒ် *saylingyang* receive final-syllable stress since this is their

Table 1.22: Stress patterns for [ $\pm$  HEAVY, + LONG] in trisyllabic words

-L -L +L	<i>peraysān</i>	x   x ǰ	‘paste’
-L +L -L	<i>raypānya</i>	x   ǰ x	‘at the stop’ (stop-LOC)
+L -L -L	<i>nōneri</i>	ǰ   ǰ x	‘deliberate, intentional’
-L +L +L	<i>mə-cān-cān</i>	x   ǰ ǰ	‘whatever fling’ (whatever=fling)
+L -L +L	<i>sānisān</i>	ǰ   x ǰ	‘copula; clutch (n.)’
+L +L -L	<i>lērayon</i>	ǰ   ǰ x	‘manwhore’
+L +L +L	—	—	—

last heavy syllable. The first syllables of *peraysān* and *maykongas*, on the other hand, lose the secondary stress they would normally be assigned as two stressed syllables after another are normally avoided; the requirement of long syllables to not be unstressed does not come into effect here. *peraysān* is also an example for the rule that even if a syllable is not heavy, the last syllable that can be assigned stress will receive primary stress.

Carrying out the same analysis as above and moving the feature [+ LONG] through the various positions, we receive the results depicted in Table 1.22.<sup>23</sup> Since long syllables override stress of both light and heavy syllables as pointed out above (p. 35), the example words in this chart contain both of these syllable types. It was not too hard finding examples for all the slots in this case either, except that words with two long syllables in succession are rather rare. Still, only the case of three long syllables must remain unattested.<sup>24</sup>

Again, we can see that long syllables attract stress, in that the final syllables of *peraysān* and *sānisān* are stressed even though the penultimate syllable is heavy on the virtue of containing a diphthong. As it is in an unstressed position and there is no requirement for the syllable to be stressed, the first syllable of *raypānya* loses stress adjacent to the stressed long penultimate syllable. *nōneri* and *lērayon* display a secondary-stressed and a primary-stressed syllable next to each other, in the first case due to the rule that long syllables must not be unstressed and *-eri* forming a valid disyllabic foot that receives regular trochaic stress, and in the second case due to two long syllables next to each other, of which

<sup>23</sup> For more precision, modifications will be made to the symbols given in footnote 21: let a double acute (ˆˆ) denote superheavy syllables with primary stress, and a double grave (˘˘) denote superheavy syllables with secondary stress.

<sup>24</sup> It would be possible to construct a word with three long syllables if the habitative suffix *-asa* did not delete the vowel at the end of the verb stem if there is one. *māsāy* ‘I traveled’ (PST-travel=ISG.TOP) would then become *\*māsāsāy* ‘I used to travel’ (PST-travel-HAB=ISG.TOP) instead of the actual form *māsasāy*; the verb stem is *asa-* ‘travel’.

the first—again—must not be unstressed. မဲးဝဲးဝဲးဝဲး *mə-cān-cān* is interesting insofar as the long-syllable stress rules operate on the second foot regularly, while the marker မဲး *mə-* ‘whatever’ is by default unstressed, so even if it is added to stressed monosyllabic words like ခဲး *hin* ‘box’, the foot of မဲးခဲး *mə-hin* ‘which box so ever’ would appear iambic, even though the syllable ခဲး *hin* itself is not heavy.

A further exception is formed by monosyllabic quantifying clitics like ခဲး *-ben* ‘all, every’ or ဘဲး *-ngas* ‘almost’. These are unstressed also when following an unstressed syllable of their host if they contain a short vowel.

### Stress in compounds

Ayeri has a number of lexicalized compound nouns that are treated as one word morphologically (33a). This is in contrast to compounds that are not as established terms, or formed ad hoc (33b):

- (33) a. *Ang bengay kardangirayya ya Litareng.*  
 ang beng=ay.Ø kardang.iray-ya ya Litareng  
 AT attend=ISG.TOP school.high-LOC LOC Litareng  
 ‘I attend university in Litareng.’
- b. *Ang pasyye Pila sungkoranyam kibas.*  
 ang pasy-ye Ø Pila sungkoran-yam kibas  
 AT be.intersted.in-3SG.F TOP Pila science-DAT map  
 ‘Pila is interested in geography.’

For purposes of surveying stress patterns, we will only deal with the kind in (33a), though it may be noted that when not being overtly inflected, the second kind of compound will be treated as a word as well: နီးခဲးဝဲးဝဲး *sungkorankibas* ‘geography’. Another kind of indivisible compound as in (33a) is one formed from reduplication, for instance, နီးခဲးနီးခဲး *kusang-kusang* ‘model’, from နီးခဲး *kusang* ‘double’. Table 1.23 gives several examples along with their stress patterns. As a reference for the various rules in operation, consider the list above (p. 35).

The first word, ခဲးဝဲးဝဲး *apan-apan*, is not very noteworthy but I included it nonetheless as a reference for regular stress assignment to light syllables. The word decomposes into two feet, each of them has trochaic stress, which does not change when reduplicated. Per rule, the first syllable of the word receives secondary stress while the penultimate syllable bears primary stress. နီးခဲးနီးခဲး *kusang-kusang* is following the normal rules as well in that a heavy syllable takes stress from a light one. This does not change in reduplication.

မဲးဝဲးဝဲးဝဲး *depangcāti* is noteworthy since it follows the same stress pattern as ခဲးဝဲးဝဲး *apan-apan* in spite of consisting of one foot with a heavy second syllable (မဲးဝဲး *de-pang*) and another with a superheavy first syllable (ဝဲးဝဲး *cāti*). To avoid a clash, stress

Table 1.23: Examples of stress patterns in compounds

Word	Pattern	Translation	Constituents					
			Word	Pattern	Translation	Word	Pattern	Translation
<i>apan-apan</i>	ˈx x   ˈx x	‘extensive’	<i>apan</i>	ˈx x	‘wide’	<i>apan</i>	ˈx x	‘wide’
<i>depangcāti</i>	ˈx x   ˈx x	‘cuckold’	<i>depang</i>	x ˈx	‘fool’	<i>cāti</i>	ˈx x	‘lover’
<i>kusang-kusang</i>	x ˈx   x ˈx	‘model’	<i>kusang</i>	x ˈx	‘double’	<i>kusang</i>	x ˈx	‘double’
<i>latunkema</i>	ˈx x   ˈx x	‘tiger’	<i>latun</i>	ˈx x	‘lion’	<i>kema</i>	ˈx x	‘stripe’
<i>malingkaron</i>	ˈx x   ˈx x	‘coast, seashore’	<i>maling</i>	x ˈx	‘shore’	<i>karon</i>	ˈx x	‘water’
<i>māvaganeng</i>	ˈx x   x ˈx	‘mother’s siblings’	<i>māva</i>	ˈx x	‘mother’	<i>ganengan</i>	x   ˈx x	‘siblings’
<i>pikunanding</i>	ˈx x   x ˈx	‘mustache’	<i>piku</i>	ˈx x	‘beard’	<i>nanding</i>	x ˈx	‘lip’
<i>sapayyila</i>	ˈx x   ˈx x	‘limbs’	<i>sapay</i>	x ˈx	‘hand’	<i>yila</i>	ˈx x	‘foot’

is not shifted to the heavy syllable in  $\text{depang}$ , since it is not strictly necessary for it to be stressed:

$$(34) \quad (*\text{dépang} \rightarrow \text{depáng}) + \text{cáti} \rightarrow \left\{ \begin{array}{l} * \text{depàng} + \text{cáti} \\ \text{dèpang} + \text{cáti} \end{array} \right\}$$

In the case of  $\text{malingkaron}$  again the rule operates that prohibits two stressed non-long syllables after another. Thus, even if the first component  $\text{maling}$  contains a heavy syllable, stress will not move there. In  $\text{latunkema}$ , the syllable /tʊn/ is assimilated to [tʊŋ] before the /k/ onset of the next syllable. For one, however, this does not make it heavy, and second, even if it did, stress would stay on the first syllable of the word for the same reason as in  $\text{malingkaron}$ . The same rule of stress hiatus avoidance operates in  $\text{sapayyila}$ .

Besides the shortening of the second component of the compound,  $\text{māvaganeng}$  retains the stress pattern of its constituents. Since /ma:/ is not in a final foot, it receives secondary stress. Moreover,  $\text{māvaganeng}$  and  $\text{pikunanding}$  both show that it is acceptable for two light syllables to follow each other.

### 1.3.2 Intonation

Peterson (2015: 66) writes that if “you’re creating a language on your own and you’re the only speaker, intonation is usually not high on the list of features to focus on, but intonational flavoring is well worth it (read: crucial) when it comes to making an authentic language.” Indeed, this has so far been a rather neglected topic in my work on Ayeri. Even though I made a handful of recordings in the past, I have never considered intonation much. Yet, of course, the spoken words in those recordings do not sound like robot speech either, so there must be intonational patterns that I have been subconsciously applying.<sup>25</sup>

Since intonation contours are notoriously difficult to display in print, I will give very approximate graphs of pitch in the respective examples for each surveyed pattern. Certainly there will be other patterns as well which would require more detailed gradations, but for the time being, I will only try to briefly describe those that are most prominent.

#### *Declarative statements*

Declarative statements have a gradually falling pitch contour based around an average pitch height, not deviating considerably on both ends:

<sup>25</sup> Whenever this happens, the fallback is likely to be a mixture of German and English, since those are the languages I am most familiar with.

(35)

*Ang gibayo Pintemis minganeri-ben yona.*  
ang giha-yo Ø Pintemis mingan-eri=hen yona  
AT blow-3SG.N TOP North Wind ability-INS=all 3SG.N.GEN.

‘The North Wind blew with all of his might.’

#### Yes-no questions

Since Ayeri does not use a particle or word order to mark closed questions as such, intonation is used to mark the difference from a declarative statement. To achieve a strong contrast, questions exhibit gradually rising intonation:

(36)

*Ang gibayo Pintemis minganeri-ben yona?*  
ang giha-yo Ø Pintemis mingan-eri=hen yona  
AT blow-3SG.N TOP North Wind ability-INS=all 3SG.N.GEN.

‘Did the North Wind blow with all of his might?’

#### ‘Wh-’ questions

Unlike English, Ayeri marks open questions with an in-situ question word. Open questions are thus marked by the question word causing a sharp rise and fall in the overall contour of the question. The first half of the clause has the rising contour of a question, the second half has gradually falling pitch.

(37)

*Ang engyo mico sinya luga toya sam?*  
ang eng-yo mico sinya-Ø luga toya sam  
AT be.more-3SG.N strong who-TOP among 3PL.N.LOC two

‘Who was the stronger of the two?’

#### Lists

List statements have the general gradual downward slope of declarative statements, but the individual items can nonetheless be marked by a pitch rise on the primary accent of each item.

(38)

*Le vacyeng seygo, disu, betay nay vasra.*  
 le vac=yeng seygo-Ø disu-Ø betay-Ø nay vasra-Ø  
 PT.INAN like=3SG.F.A apple-TOP banana-Ø berry-Ø and nut-Ø

‘She likes apples, bananas, berries and nuts.’

### Complement and relative clauses

Complement clauses are characterized by the short spike at the end of the preceding main clause followed by a short break which together signal the beginning of a new syntactic unit within the context of the current sentence, which is broadly similar to list statements. Otherwise, statements with complement clauses as well bear the overall downward-sloping contour of declarative statements if included in such.

(39)

*Ang manga rantong, engyo mico sinyāng.*  
 ang manga ran=tong eng-yo mico sinyang  
 AT PROG argue=3PL.N.A be.more=3SG.N strong who-A

‘They were arguing who is stronger.’

Relative clauses, on the other hand, do not receive special prosodic marking, but are treated the same as other basic sentence types. They display a continuous downward slope if part of a declarative statement, or a continuous upward slope if part of a question:

(40) a.

*Lugaya asāyāng si sitang-naykonyāng kong tova.*  
 luga-ya asāya-ang si sitang=naykon=yāng kong tova-ya  
 pass=3SG.M traveler-A REL self=wrap=3SG.M.A inside cloak-LOC

‘A traveler passed who had wrapped himself into a cloak.’

b.

*Adareng asāyās si le ninyāng tova?*  
 ada-reng asāya-as si le nin=yāng tova-Ø  
 that-A.INAN traveler-P REL PT.INAN wear=3SG.M.A coat-TOP

‘Is that the traveler who wore the coat?’

*Contrast*

Ayeri uses a kind of topic system for highlighting constituents in a clause by morphosyntactic means, but this is still different from emphasis on semantic grounds, for example when the speaker wants to highlight a semantic difference in the same syntactic position, as in the following example, which presents a possible answer to the question posed in (4ob):

(4t)

<i>Adareng</i>	<i>asāyās</i>	<i>si</i>	<i>le</i>	<i>nin-yāng</i>	<i>kegan.</i>
ada-reng	asāya-as	si	le	nin=yāng	kegan-Ø
that-A.INAN	traveler-P	REL	PT.INAN	wear=3SG.M.A	hat-TOP

‘It is the traveler who wore the *hat*.’

We can see here a spike towards the end of the utterance where the word <sup>ḥḥ</sup>*kegan* ‘hat’ is placed. This word receives extra stress for contrast with <sup>ḥḥ</sup>*tova* ‘coat’, which is what the other person had asked about.

## 2 Writing system

In the previous chapter, example words were given in Ayerī's script, ၵၵၵၵၵ ၵၵၵၵ *Tabano Hikamu*, wherever possible. Thus, it seems advisable to include a description of Ayerī's native writing system here as well. Literally, ၵၵၵၵၵ ၵၵၵၵ *Tabano Hikamu* means 'Round Script' (script round), which is an old formation based on the word ၵၵၵၵ *taban-* 'write' that stuck. The current word for 'script' is ၵၵၵၵ *tabanan* 'writing'. Tahano Hikamu was originally named thus because of an earlier draft for a script that never made it very far beyond the drawing board and which was a lot more angular and boxy, see Figure 2.1—Tahano Hikamu was a lot more bubbly in comparison, especially early on (Figure 0.2).<sup>1</sup>

As we have seen in the previous chapter, Ayeri's prosody strongly emphasizes the syllable as a unit. Thus, it is not a surprise that Ayeri's native script, Tahano Hikamu, is an alphasyllabary similar to the Brāhmī alphabets of India and Southeast Asia (Salomon 1996; Court 1996). Scripts like these are

based on the unit of the graphic “syllable” [...], which by definition always ends with a vowel (type V, CV, CCV, etc.). Syllables consisting of a vowel only (usually at the beginning of a word or sentence) are written with the *full* or *initial vowel signs* [...]. But when, as is much more frequently the case, the syllable consists of a consonant followed by a vowel, the vowel is indicated by a diacritic sign attached to the basic sign for the consonant [...]. (Salomon 1996: 376)

For Tahano Hikamu the definition that a syllable consisting only of a vowel is written with an initial vowel sign is only true under certain circumstances, as we will see below. Moreover, Brāhmī scripts are often characterized by conjuncts of clustered consonants which may become quite large and sometimes behave in an idiosyncratic way. Consonant conjuncts like Devanāgarī त्व ⟨tva⟩ from त ⟨ta⟩ + व ⟨va⟩ or idiosyncratic conjuncts like क्ष ⟨kṣa⟩ for क ⟨ka⟩ + ष ⟨ṣa⟩ are not known in Tahano Hikamu, however. Subscript notation for consonant clusters and special diacritics marking coda consonants like in Javanese (Kuipers and McDermott 1996: 478–479) are equally unknown to Tahano Hikamu. This does not mean, however,

<sup>1</sup> Unfortunately, there is no documentation of the Box script surviving that I know of.

(a) Old and aborted draft: Box script

(b) Ayeri's native script: Tahano Hikamu

Figure 2.1: Box script and Hikamu

that final consonants are simply omitted in writing, since closed syllables are reasonably common enough in Ayeri to warrant indicating them. Thus, there is “a special mark to eliminate the vowel of the previous syllable, thereby leaving a consonant in a syllable-final position” (Kuipers and McDermott 1996: 476). That is, a diacritic exists which marks the absence of an inherent vowel, rendering the syllable consonant-only.

Another difference from Brāhmī-family scripts is that vowel length and diphthongs in [i] are indicated by dedicated diacritics, so the long vowels are not doubled versions of their short counterparts. Like in Kharoṣṭhī—another historically important ancient script of India—initial vowels are not represented by unique graphemes but they are all written like post-consonantal vowel diacritics (Salomon 1996: 377), though in Tahano Hikamu with a character without an inherent sound value. For this reason, the character is indicated in the table below as  $\emptyset$  /Ø/; its native name is  $\text{ṛṇṇ}$  *ranyan* ‘nothing’.<sup>2</sup> Similar to a number of Brāhmī scripts, Tahano Hikamu puts diacritics not only below or above consonant bases, but also before them. This, however, is not limited to vowel graphemes as in Devanāgarī ि ⟨i⟩ or Javanese ꦺ ⟨e, é/è⟩ (Kuipers and McDermott 1996: 478).<sup>3</sup>

<sup>2</sup> I will give the native names of graphemes here, but will refer to them by their English names for clarity in the running text.

<sup>3</sup> Kuipers and McDermott (1996) do not say, but it seems that both might be related, since they are both functionally the only prepended vowel diacritics and both represent a high front sound; this is just a guess, however.

Table 2.1: The consonant graphemes

/pa/	/ta/	/ka/	/ba/	/da/	/ga/
ᵑ	ᵑ	ᵑ	ᵑ	ᵑ	ᵑ
/ma/	/na/	/ŋa/	/va/	/sa/	/ha/
ᵑ	ᵑ	ᵑ	ᵑ	ᵑ	ᵑ
/ra/	/la/	/ja/	/Ø/		
ᵑ	ᵑ	ᵑ	ᵑ		

## 2.1 Consonants

Tahano Hikamu is mainly based on consonant bases that are modified by diacritics. Since the vowel /a/ is so highly frequent in Ayeri, it is also the vowel that is *inherent* to every consonant grapheme if not further modified by vowel diacritics. Consonant letters are simply referred to as *pa*, *ta*, *ka*, ... Table 2.1 displays all the main consonants. The customary collation is—similar to the IPA table—roughly grouping the letters according to their sound value by anteriority (front → back) and sonority (low → high). The script is monocameral, that is, there is no distinction between capital letters and minuscule letters as in the Latin, Greek, Cyrillic, Georgian, and Armenian alphabet. It is also written in lines from left to right.

ᵑ, which in Ayeri has no sound value but is used as a base for initial vowels, may also serve as the character for /ʔa/. What is, moreover, interesting about ᵑ ⟨nga⟩ is that even though before, /ŋ/ was treated strictly as a coda consonant in the previous chapter, it is in fact treated as an onset consonant in writing if a vowel is following:

- (1) ᵑ + ᵑ  
 /pa/      /ŋis/  
 ᵑ pangis /paŋ.is/ ‘money’

Tahano Hikamu knows a few ligatures. First of all, when two ᵑ ⟨na⟩ are in succession within a word, they will form a ligature ᵑ ⟨nana⟩:

- (2) ᵑ + ᵑ → ᵑ  
 /na/      /na/      /nana/

This is distinct from conjuncts like in Devanāgarī et al., though, since the unmodified sound value will still be /nana/, not \*/nna/, so the inherent vowel of each ᵑ

Table 2.2: Additional consonant graphemes

/fa/	/wa/	/tsa/	/za/	/ʃa/	/ʒa/
ṃ	ṃ	ṃ	ṃ	ṃ	ṃ
/ɕa/	/ksa/	/kwa/	/xa/	/ɣa/	
ṃ	ṃ	ṃ	ṃ	ṃ	

Table 2.3: Primary vowel graphemes

	/i/	/e/	/a/	/o/	/u/	/ə/	/au/
Diaritics	ṃ	ṃ	(ṃ)	ṃ	ṃ	ṃ	ṃ
Independent	ṃ	ṃ	ṃ	ṃ	ṃ	ṃ	ṃ

⟨na⟩ is not deleted, and each ṃ ⟨na⟩ retains the ability to be modified by diacritics. Tahano Hikamu also has a few ligatures of the kind you would find in Brāhmī scripts. The difference is that they are not productive, but fossilized.

- (3) a. ṃ ⟨kwa⟩ ← ṃ ⟨ka⟩ + ṃ ⟨va⟩,  
 b. ṃ ⟨tsa⟩ ← ṃ ⟨ta⟩ + ṃ ⟨sa⟩, and  
 c. ṃ ⟨ksa⟩ ← ṃ ⟨ka⟩ + ṃ ⟨sa⟩.

These conjunct letters are, however, not normally employed by Ayeri. Table 2.2 shows all additional consonants, added to write other languages. Individual languages may adapt the sound values slightly to fit their own purposes.

## 2.2 Vowels

As mentioned above, vowels are written as diacritics that are added to consonants. In principle, every consonant has two slots for vowels, a primary one atop it, and a secondary one below it. Vowels added to consonants in the primary slot delete their inherent /a/:

- (4) ṃ → ṃ  
 /pa/      /pe/

Table 2.3 gives the primary vowel signs. Of the vowel signs given there, only ṃ ⟨ə⟩ is not used in Ayeri. ṃ ⟨au⟩ is the only diphthong for which a dedicated

Table 2.4: Secondary vowel graphemes

/i/	/e/	/a/	/o/	/u/	/ə/	/au/

grapheme exists, even though its occurrence is rather limited. The independent vowel graphemes are used at the beginning of words or inside words when there is no other way to spell the vowel, which is occasionally the case for secondary vowels. Secondary vowels are vowels that are not parts of diphthongs (even though another language might use them to spell diphthongs that are not covered by default), but follow the vowel of a syllable directly. They are attached underneath a consonant base, for example:

- (5) ယ → ယိ → ယီ  
       /ja/        /je/        /jea/

In fact, the principle that every consonant base with its diacritics represents one syllable is slightly violated here, which is also the reason why secondary vowels very occasionally need to be spelled as independent vowels, for example when the secondary vowel is long, as in the word ရွာ *ruān* ‘duty’:

- (6) ဂ် → ဂ်ရွာ (ဂ်ရွာ)  
       /ru/        /rwa:/        /ru:a/

Example (6) uses a diacritic, ရွာ, to indicate length. If ရွာ is put directly under ဂ် *ru* (the ရွာ diacritic moves down where it is not in the way), the syllable will incorrectly spell /ru:a/ instead of the intended /rua:/. This is because diacritics modify consonants and primary vowels, but there is no way to modify a secondary vowel directly. Table 2.4 gives a list of secondary vowels corresponding to that of primary vowels above. The vowels as well are just referred to by their sound value; ‘primary’ and ‘secondary’, ‘superscript’ and ‘subscript’ or ‘upper’ and ‘lower’ may be chosen to disambiguate their positions; the native names may use ရွာ *iray* ‘high’ and ရွာ *eyra* ‘low’ to disambiguate, so ရွာ *e iray* denotes the superscript ⟨e⟩ diacritic while ရွာ *e eyra* denotes its subscript counterpart.

As a further exception, those consonant bases with an ascender (ခ <ka>, ပ <da>, ခ <ça/>) move the primary vowel to the secondary slot below the consonant by default while indicating the vacancy of the primary slot at the top with a dot. This is done to avoid crossing the ascender of the consonant with a vowel diacritic:

$$(7) \quad \begin{array}{ccccc} \text{ᑭ} & \rightarrow & \text{ᑭᑭ} & \rightarrow & \text{ᑭᑭᑭ} \\ /ka/ & & /ka.i/ & & /ki/ \end{array}$$

If the primary vowel slot were not silenced by the  $\circ$  diacritic, it could reasonably be assumed that the consonant is not losing its inherent /a/ and the vowel below the consonant indicates a secondary vowel, spelling /CaV/. If, however, a secondary vowel is *actually* added, primary and secondary vowels will be assigned the regular primary and secondary slots, respectively, again (8a). This condition also holds true for subscript diacritics (8b).

$$(8) \quad \begin{array}{lcl} \text{a.} & \begin{array}{ccc} \text{ᑭ} & \rightarrow & \text{ᑭᑭ} \\ /ki/ & & /ki.e/ \end{array} \\ \text{b.} & \begin{array}{ccc} \text{ᑭ} & \rightarrow & \text{ᑭᑭ} \\ /ki/ & & /ki:/ \end{array} \end{array}$$

The order of secondary vowels and subscript diacritics is iconic insofar as it follows the order of sounds in the syllable. Thus, secondary vowels appear below the consonant-doubling diacritic,  $\circ$ , while they appear above the syllable-final homorganic nasal diacritic,  $\circ$ :

$$(9) \quad \begin{array}{lcl} \text{a.} & \begin{array}{ccc} \text{ᑭ} & \rightarrow & \text{ᑭᑭ} \\ /ppa/ & \rightarrow & /ppea/ \end{array} \\ \text{b.} & \begin{array}{ccc} \text{ᑭ} & \rightarrow & \text{ᑭᑭ} \\ /peN/ & \rightarrow & /peaN/ \end{array} \end{array}$$

## 2.3 Diacritics

We have already encountered a few diacritics, though Tahano Hikamu comes with a lot more, some of which undergo non-trivial positioning and repositioning rules. As vowels are primarily expressed as superscripts, diacritics are primarily realized as subscripts, so in the following I will first describe subscript diacritics; then prepended diacritics, which Ayeri also has a number of, both as graphemes in their own right and as allographs of other subscript diacritics; and then, lastly, superscript diacritics.

### 2.3.1 Subscript diacritics

Table 2.5 shows the bottom-attaching diacritics. The ‘large diacritics’ (ᑭ through ᑭ) cause the secondary slot of consonants to move down below the diacritic. ‘Small

Table 2.5: Bottom-attaching diacritics

	Native name	Function	Example
◌̄	တုပာဆိ <i>tupasati</i> ‘long-maker’	Lengthens the primary vowel of the syllable	၎ <i>pa</i> → ပျ <i>pā</i>
◌့	ယုရော <i>ya eyra</i> ‘low ya’	⟨ya⟩ following another consonant, also across syllables. Marks palatalization of တ <i>ta</i> , သ <i>da</i> , ခ <i>ka</i> , ဂ <i>ga</i> and ယ <i>ya</i> in Ayeri.	အာ <i>ara</i> → အျာ <i>arya</i> ; တာ <i>ta</i> → တျာ <i>ca</i>
◌့	ရိဂယ <i>ringaya</i> ‘raiser’	Palatalizes a consonant (not used in Ayeri)	တာ <i>ta</i> → တျာ <i>/tʰa/</i> , <i>/tʃa/</i>
◌့	အိလငယ <i>ulangaya</i> ‘breather’	Aspiration or frication of a consonant (not used in Ayeri)	တာ <i>ta</i> → တျာ <i>/tʰa/</i> , <i>/θa/</i>
◌့	ရပယုရော <i>raypāya eyra</i> ‘low stopper’	Glottal stop coda or glottalization of a consonant (consonant letters with ascenders; not used in Ayeri)	ခ <i>ka</i> → ချ <i>/kaʔ/</i> ; သ <i>da</i> → သျ <i>/dʰa/</i>
◌့	ဂိယ <i>gondaya</i> ‘extinguisher’	Deletes the inherent <i>/a/</i> of a consonant, e.g. in consonant clusters or closed syllables	၎ <i>para</i> → ပာ <i>pra</i> , ပာ <i>par</i>
◌့	ဝိနာ <i>vināti</i> ‘nasalizer’	Indicates a homorganic nasal or nasalizes the vowel, depending on the language	၎ <i>pada</i> → ပာ <i>panda</i> <i>/panda/</i> or <i>/pāda/</i>
◌့	ကွေအိယ <i>kusangisāti</i> ‘duplicator’	Indicates a geminated or otherwise double consonant	၎ <i>pala</i> → ပာ <i>palla</i>

diacritics' (◌◌ through ◌◌) can attach in this place as well as secondary vowels, as does the homorganic nasal diacritic ◌◌ in this diacritic-fraught example:

- (10)  $\text{တၢ်နီၤ} + \text{ပုၤလၢ} \rightarrow \text{တၢ်နီၤပုၤလၢ}$   
 /tʃa:n/      /pu'lɔ/      /tʃa:mpu'lɔ/  
 တၢ်နီၤပုၤလၢ *cāmpuluy* 'heterosexual'

It also needs to be noted that diacritics like ◌◌ are applied progressively to words as a whole, not stopping at morpheme and syllable boundaries, so even though *toryeng* 'she sleeps' may be composed of တၢ်: *tor-* 'sleep' + ပုၤ *-yeng* (=3SG.F.A) and syllabifies as /tor.'jeŋ/, the spelling is not \*တၢ်ပုၤ as one might expect, but တၢ်ပုၤ.

Even though the primary position for small diacritics is underneath consonants, the diacritic deleting the inherent vowel, ◌◌, very commonly also appears after a consonant letter at the end of words:

- (11) ပ      နီၤပုၤလၢ      ပုၤလၢ      နီၤပုၤလၢ  
*ya      nimreng      pangan      narānyena.*  
*ya      nim-reng      pangan-Ø      narān-ye-na*  
 LOCT   appear=3SG.INAN.A   end-TOP   word-PL-GEN  
 'It appears at the end of words.'

This strategy is advantageous in that Tahano Hikamu leaves very little space between individual words: ပနီၤပုၤလၢပုၤလၢနီၤပုၤလၢ. With the dot after the consonant, word boundaries are more visible.

### 2.3.2 Prepended diacritics

Example (10) leads us directly to the next class of diacritics—those that are prepended to the consonant letter, either because they are simply placed there or because of allography. Let us first list those diacritics that appear in front of consonants obligatorily (Table 2.7).

As Table 2.7 shows, the only obligatorily prepended diacritic that Ayeri uses is the one that marks diphthongs, ◌◌. It needs to be noted here that ◌◌ changes into ပ (◌◌) proper when a vowel follows, but stays ◌◌ when a ပ (◌◌) follows:

- (12) a. ပုၤ *baday* 'hero' → ပုၤပုၤ (\*ပုၤပုၤ) *badayang* 'the hero' (hero-A);  
 b. နီၤ *tipuy* 'grass' → နီၤပုၤ (\*နီၤပုၤ) *tipuyya* 'in the grass' (grass-LOC).

<sup>4</sup> In a Tahano Hikamu orthography I devised for English once, ◌◌ was used for /ə/, as in the NURSE vowel in American English: နီၤ *nurse*.

Table 2.7: Obligatorily prepended diacritics

Native name	Function	Example
၂ <sup>○</sup> ကုလ်ဃံကု <i>lentankusang</i> ‘double-sound’	Marks a diphthong with /ɪ/	ပံ <i>pe</i> → ပံ၂ <i>pey</i>
၃ <sup>○</sup> တီလံဗယံ <i>tilamaya</i> ‘changer’	Marks raised vowels (i.e. umlaut; not used in Ayeri)	ပံ <i>po</i> → ပံ၃ <i>/pø/</i>
၃ <sup>○</sup> ဟိယံဗယံ <i>hiyamaya</i> ‘roller’	Marks retroflex consonants (not used in Ayeri) <sup>4</sup>	တံ <i>ta</i> → တံ၃ <i>/tʰa/</i>

Table 2.8: Allographically prepended diacritics

Native name	Function	Example
၁ <sup>○</sup> တုပာသတိမာရ် <i>tupasati marin</i> ‘anterior long-maker’	Lengthens the primary vowel of the syllable	ဟံ <i>syā</i> → ဟံ၁ <i>syā̄</i> , နံ <i>na</i> → နံ၁ <i>nā</i>
၂ <sup>○</sup> ယာမာရ် <i>ya marin</i> ‘anterior ya’	⟨ya⟩ following another consonant, also across syllables.	နံ <i>na</i> → နံ၂ <i>nya</i>
ကံ၂ယာမာရ် <i>ringaya marin</i> ‘anterior raiser’	Also used as an allograph for the palatalization proper diacritic.	ဟံ <i>/sh̥a/</i> → ဟံ၂ <i>/sh̥j/</i>
၁ <sup>○</sup> ဝလံဂာယာမာရ် <i>ulangaya marin</i> ‘anterior breather’	(Pre-)Aspiration or frication of a consonant (not used in Ayeri)	ကံ <i>nga</i> → ကံ၁ <i>/ŋʰa/</i> ; တံ <i>ta</i> → တံ၁ <i>/tʰa/</i>

Besides  $\text{ၵၵ}$ , there are also a number of diacritics that are also obligatorily prepended to consonants, but do so as context-sensitive allographs (Table 2.8). The selection of the variant diacritics is not random or up to the aesthetic eye of the writer (even though the device itself is certainly a matter of aesthetics), but it is governed by rules. The prepended forms listed in Table 2.8 are thus triggered

1. when there is no stem or bowl for the regular subscript diacritic to attach to, which is the case for  $\text{ၵ}$  <na>,  $\text{ၵၵ}$  <nga>,  $\text{ၵၵ}$  <va>, and  $\text{ၵၵ}$  <wa>:

$$\begin{array}{ll}
 (13) \quad \text{a. } \text{ၵ} \rightarrow \text{ၵၵ} & \text{c. } \text{ၵၵ} \rightarrow \text{ၵၵၵၵ} \\
 \quad \quad \quad /na/ & \quad \quad \quad /na:/ \\
 \quad \quad \quad \text{b. } \text{ၵၵ} \rightarrow \text{ၵၵၵၵ} & \text{d. } \text{ၵၵၵၵ} \rightarrow \text{ၵၵၵၵၵၵ} \\
 \quad \quad \quad /ၵa/ & \quad \quad \quad /ၵa:/ \\
 \quad \quad \quad & \quad \quad \quad /wa/ \quad \quad \quad /wa:/
 \end{array}$$

2. when a large subscript diacritic would be added after another large subscript diacritic—this position can only be occupied once, so further large subscripts are prepended:

$$\begin{array}{ccccccc}
 (14) & & + \text{ၵ} & & + \text{ၵ} & & + \text{ၵ} & & + \text{ၵ} \\
 & \text{ၵ} & \rightarrow & \text{ၵၵ} & \rightarrow & 2\text{ၵၵ} & \rightarrow & 2\text{ၵၵၵ} & \rightarrow & 22\text{ၵၵၵ} \\
 & /ta/ & & /t^ha/ & & /t^hja/ & & /t^hji/ & & /t^hji:/
 \end{array}$$

The order of diacritics follows the logic of the respective language's phoneme inventory, so if there are, for example, retroflex consonants and both dental and retroflex consonants can be aspirated, retroflexion would be marked first, then aspiration. If there is a palatalization contrast on top of this, the diacritic would be added after aspiration.

When adding large diacritics to stemless consonants, they are prepended from the beginning, as we saw in (13), and just like in (14), this principle continues:

$$\begin{array}{ccccccc}
 (15) & & + \text{ၵ} & & + \text{ၵ} & & + \text{ၵၵ} \\
 & \text{ၵ} & \rightarrow & 2\text{ၵ} & \rightarrow & 22\text{ၵ} & \rightarrow & 322\text{ၵ} \\
 & /na/ & & /nja/ & & /nja:/ & & /nja:v/
 \end{array}$$

3. with consonants directly following  $\text{ၵ}$  <na>, to avoid a clash with its swash:

$$(16) \quad \underset{/na/}{\text{Ⴌ}} + \underset{/pa:/}{\text{Ⴌ}} \rightarrow \underset{/napa:/}{\text{ႬႬ}} \quad (*\text{ႬႬ})$$

An exception to this exception occurs, however, when the consonant is not directly following. In this case, no reordering happens, only Ⴌ ⟨na⟩ *may* reduce its swash in size to accommodate the following prepended diacritic:<sup>5</sup>

$$(17) \quad \underset{/na/}{\text{Ⴌ}} + \underset{/pai/}{\text{ႬႬ}} \rightarrow \underset{/napai/}{\text{ႬႬႬ}} \quad (^\text{?}\text{ႬႬႬ})$$

4. in other cases where a clash of subscript diacritics needs to be avoided:

$$(18) \quad \underset{/di/}{\text{ႬႬ}} + \underset{/pa:/}{\text{Ⴌ}} \rightarrow \underset{/dipa:/}{\text{ႬႬႬ}} \quad (*\text{ႬႬႬ})$$

Alternatively, the following solution is permissible:

$$(19) \quad \underset{/di/}{\text{ႬႬ}} + \underset{/pa:/}{\text{Ⴌ}} \rightarrow \underset{/dipa:/}{\text{ႬႬႬ}}$$

When two long syllables follow each other, as in *bāmā* ‘mom-and-dad’, one of the length diacritics should definitely be pulled to the front:

$$(20) \quad \begin{array}{l} \underset{/ba:/}{\text{ႬႬ}} + \underset{/ma:/}{\text{ႬႬ}} \rightarrow \underset{/ba:ma:/}{\text{ႬႬႬႬ}} \quad (^\text{?}\text{ႬႬႬႬ}) \\ \text{or:} \quad \underset{/ba:/}{\text{ႬႬ}} + \underset{/ma:/}{\text{ႬႬ}} \rightarrow \underset{/ba:ma:/}{\text{ႬႬႬႬ}} \end{array}$$

Generally, prepended diacritics apply only to a single consonant grapheme, not a whole consonant cluster as such. Thus, for instance, in words like *pray* ‘smooth’ ႬႬ appears before Ⴌ ⟨ra⟩, not before Ⴌ ⟨pa⟩, since Ⴌ ⟨ra⟩ is the closest consonant before the syllable nucleus which we are modifying by adding the ႬႬ. Since in the case of *pray* the inherent vowel of Ⴌ ⟨pa⟩ is silent, it receives a diacritic Ⴌ to mark this fact:

<sup>5</sup> The font I am using here is designed so that the reduced combination looks nicer, but if unreduced, Ⴌ ⟨na⟩’s swash is not so long as to cross the descender of ႬႬ either in this particular case.

(21)     $\text{ṛṛ}$        $(^*\text{ṛṛ})$   
           /prai/

What (21) shows is that essentially, /prai/ is split into /p/ + /rai/ for purposes of spelling, rather than /pr/ + /ai/. If necessary, it is also possible this way to distinguish, for instance,  $\text{ṛṛ}$  /tʃa/ from  $\text{ṛṛ}$  /tʃa/. It would be up to the respective language's orthography to decide whether either combination spells /tʃa/ or whether the  $\text{ṛ}$  diacritic is needed on both consonants—that is,  $\text{ṛṛ}$ —to spell the retroflex affricate.

### 2.3.3 Superscript diacritics

Ayeri's standard position for diacritics is below consonants, but sometimes it is nicer to put them on top, especially for the letter  $\text{ṛ}$  (na) due to its swash, as well as for  $\text{ṛ}$  (va) since the space below its flag is empty otherwise, thus not providing much of a visual connection. The only diacritic that is normally attaching to the top of consonants is that for the glottal stop—we have already encountered its subscript allograph earlier. Since Ayeri's phoneme inventory does not possess a phonemic glottal stop or glottalization, this diacritic is not used in Ayeri. The list of superscript diacritics is given in Table 2.9.

At times, it may be necessary to attach both a superscript diacritic and a vowel sign above a consonant. In this case, the consonant-modifying diacritic is placed first and the vowel diacritic on top of it—this is exactly equivalent to the rule exemplified for subscript diacritics in (9).

(22) a.     $\text{ṛ}$      $\rightarrow$      $\text{ṛ}$   
               /vva/    $\rightarrow$    /vve/  
       b.     $\text{ṛ}$      $\rightarrow$      $\text{ṛ}$   
               /vva/    $\rightarrow$    /vvaN/

## 2.4 Numerals

Ayeri uses a duodecimal number system, that is, a system based on the powers of 12, which is a typological rarity.<sup>6</sup> There is a digit for zero, so the system is positional, like the Hindu–Arabic digits used by the Latin alphabet. The numerals for the numbers from 1 to 12 are shown in Table 2.10.

<sup>6</sup> And one possibly overrepresented by fictional languages due to its rarity in natural languages.

Table 2.9: Superscript diacritics

Native name	Function	Example
◌် ꨀꨣꨩꨣꨩꨣꨩ <i>gondaya ling</i> ‘upper extingisher’	Deletes inherent /a/ of consonant, e.g. in consonant clusters or closed syllables	ṽṽ <i>vara</i> → ṽṽ <i>vra</i>
◌် ꨀꨣꨩꨣꨩꨣꨩ <i>vināti ling</i> ‘upper nasalizer’	Indicates a homorganic nasal or nasalizes the vowel, depending on language/context	ṽṽ <i>naka</i> → ṽṽ <i>nanka</i> /naṅka/ or /nāka/
◌် ꨀꨣꨩꨣꨩꨣꨩ <i>kusangisāti ling</i> ‘upper duplicator’	Indicates a geminated or otherwise double consonant	ṽṽ <i>pana</i> → ṽṽ <i>panna</i>
◌် ꨀꨣꨩꨣꨩꨣꨩ <i>raypāya stopper</i>	Glottal stop coda or glottalization of a consonant (not used in Ayeri)	ṽṽ <i>ta</i> → ṽṽ /taʔ/; ṽṽ <i>sa</i> → ṽṽ /sʔa/

Table 2.10: The numerals

1	2	3	4	5	6
ṽṽ	ṽṽ	ṽṽ	ṽṽ	ṽṽ	ṽṽ
7	8	9	A	B	10
ṽṽ	ṽṽ	ṽṽ	ṽṽ	ṽṽ	ṽṽ

## 2.5 Punctuation and abbreviations

Tahano Hikamu’s system of manipulating the sound of syllables is very sophisticated, so it comes as no surprise that it is also host of a large number of punctuation marks. Table 2.11 lists the ones commonly encountered, Table 2.12 the ones not so commonly encountered.

◌ (◌) does not look very much like a dot or a point, but it is derived from a sign that looks like two circles stacked on top of each other, similar to : ◌ (see Figure 0.2). There is no mark for a comma as such, so : ◌ or – ◌ cannot be used in this way. Instead of a comma, a wide word space is used to separate syntactic units. A long dash — ◌ is also sometimes found at the end of paragraphs or texts to mark their end. The strong exclamation mark ◌ may appear in its exclamatory

	Native name	Function	Example
။	ၵ်း <i>dan</i> ‘dot’	Full stop	ဧကယျာ။ <i>Sarayāng</i> . ‘He left.’
း	ၵ်းၵ်း <i>dan-dan</i> ‘little dot’	A separator for small things, like clitics and abbreviations; divides the constituents of reduplication	ဧၵ်းၵ်း <i>ada-nanga</i> ‘this house’; ဧၵ်း ၵ်း <i>pd</i> ‘5 hrs’; ၵ်းၵ်း <i>dan-dan</i> ‘dot-dot, little dot’
—	ၵ်းၵ်း <i>puntān</i> ‘dash’	General sign for a longer pause, equivalent to a dash, colon, semicolon, brackets	ယၵ်း—ဧၵ်း <i>Yan – saru!</i> ‘Yan – go!’
ၵ	ၵ်းၵ်း <i>damprantan</i> ‘question point’	Marks questions	ဧၵ်းၵ်း <i>Manisu?</i> ‘Hello?’
ၵ	ၵ်းၵ်း <i>dambahān</i> ‘shouting point’	Marks exclamations; strong exclamations may be marked by the ~ variant.	ဧၵ်းၵ်း <i>Manisu!</i> ‘Hello!’; ဧၵ်း <i>Yi!</i> ‘Urgh!’

Regarding the less common marks, some of these seem like all to bland copies of modern punctuation in the Latin alphabet, especially the brackets and the decimal point. Still, however, they may serve their purpose sometimes, and the brackets may maybe come with the redeeming notion that they push off the text around the inclusion rather than encapsulating the inclusion within it, so the visual effect is slightly different. The name brackets are interesting and maybe useful insofar as many names in Ayeri are derived from common words, for example, ᐃᓴᓂᐅ *Ajān*, a male name, is literally ‘play, game’, relating to a playful character; ᐃᓴᓂᐅ *Migoray*, a female name, literally means ‘flower’. The name brackets, then, make it unmistakably clear that a proper noun is intended rather than a common noun. The line-breaker serves the purpose of marking the continuation of a clause at the end of a line either generally or where there would be ambiguity with a comma, which, as described above, is a large blank that would otherwise be invisible at the end of a line.

Two very common abbreviations are symbolic in nature, like the ampersand (&) in the Latin alphabet, and incidentally, they correspond to it in that the very com-

Table 2.12: Less common punctuation marks

Native name	Function	Example
◌ <sup>◌</sup> ◌ <sub>◌</sub> မ်းဝ်း <i>danarān</i> ‘speaking point’	Quotation marks	ၵုၵ်းမ်းဝ်း <i>Narayāng</i> “ <i>Manisu!</i> ” ‘He says, “Hello!”’
◌◌    မ်းဝ်း <i>dankayvo</i> ‘beside-point’	Bracketing of text	ၵုၵ်းမ်းဝ်း <i>bahis (larau)</i> ‘a (nice) day’
◌ <sup>◌</sup> မ်းဝ်း <i>dangaran</i> ‘name-point’	Explicitly marks a name as such. For the closing name parenthesis, ◌ can be found as well.	ၵုၵ်းမ်းဝ်း <i>Ajān Savati</i> ; ၵုၵ်းမ်းဝ်း <i>Pila Lay Maran</i>
◌    မ်းဝ်း <i>dansinday</i> ‘number-point’	Marks (duo)decimal fractions	ၵုၵ်းမ်းဝ်း <i>17.4582</i> ‘19.37482’
◌    မ်းဝ်း <i>adrumaya</i> ‘breaker’	Marks line breaks within a phrase	

mon small word *ꠠꠣ* *nay* ‘and’ may be abbreviated as *ꠠ*. Based on this, its reduplicated form *ꠠꠠ* *naynay* ‘furthermore, also’ may be abbreviated as *ꠠ*.

## 2.6 Styles

Over the course of the years since Tahano Hikamu’s inception, I have liked to experiment with different styles of writing, that is, I tried applying a number of different writing styles to the script to change its look and feel while still staying true to the overall character shapes and the system behind the script. The example text I will be using to illustrate the different styles in the following is an Ayeri translation of the first article of the United Nations *Universal declaration of human rights* (Becker 2011a):

*Sa vesayon keynam-ikan tiganeri nay kaytanyeri sino nay kamo.  
Ri toraytos tenuban nay iprang, nay ang mya rankyon sitanyās ku-netu.*

[All human beings are born free and equal in dignity and rights.  
They are endowed with reason and conscience and should act towards each other in  
a spirit of brotherhood.] (United Nations 1948: Article 1)

The examples above are all using a style I call ‘book’ style since it comes close to printed letters, or also what might be conceivable as being written with quills or

ករណីនេះ គ្រប់គ្រងនៃការប្រកួតប្រជែង គឺជាបញ្ហា។  
 ក៏ដោយ ក៏ការប្រកួតប្រជែង គឺជាបញ្ហា។ ប្រសិនបើ យើងមិន  
 ដឹងពីការប្រកួតប្រជែង យើងក៏មិនដឹងពីការប្រកួតប្រជែង។

Figure 2.2: Tahano Hikamu, 'book style'

[illegible]

Figure 2.3: Tahano Hikamu, ‘angular style’

Neatly reproducing the shapes of either the ‘book’ style or the ‘angular’ style by hand goes rather slowly, so I was wondering what daily handwriting could look like. Of course, this presupposes pen and paper again; Salomon (1996: 377) mentions that inscriptions of Brāhmī and related scripts have been found on copper plates and plates made of other metals, besides stone. Metal plates can be inscribed with metal styluses and should allow similar shapes as modern pens. Wax tablets—a staple in European literacy until the use of paper became widespread—should as

<sup>7</sup> For examples, see Everson (2008), or *Wikipedia*.

well allow for relative freedom of stroke direction, so character shapes are probably not implausible even without assuming that pen and paper are (widely) available. Figure 2.4 shows what Tahano Hikamu might look like quickly jotted down by hand.

Figure 2.4: Tahano Hikamu, ‘hand style’

Many letter shapes become simplified, specifically ခ (ba), ခ (ga), ခ (ka), ခ (na), ခ (nga), the vowel carrier ခ, and the vowel ဝ (i). Not shown here is the the vowel length diacritic, ခ, which is simplified to a reverse C shape. The abbreviation ခ *nay* ‘and’ is used throughout, though in a shape that is more similar to its ‘angular’ form ခ. ခ (na) is also taken from the ‘angular’ style ခ, which opens the possibility that this is actually the basic shape rather than the ‘book’ style’s ခ, or both are different developments from a shared ancestor.

Most recently, I also wondered what Tahano Hikamu might look like if it were adapted to European blackletter style with its characteristic broken arches. This, of course, constitutes a sharp contrast to Ayer’s usual look and feel, which made the experiment all the more interesting, though decidedly non-‘canonic’. Figure 2.5 shows what our example passage might have looked like at a time when Gothic book hands flourished.

Figure 2.5: Tahano Hikamu, ‘blackletter style’

The letter shapes from the ‘book’ style stay largely intact here, though all curves are broken up into at least two strokes, and strokes from the bottom right to the top left, which push a quill in a way that may cause ink to splatter from scratching, are avoided completely. The characters that differ most are ခ (ga), ခ (ra), ခ (nga), and the vowel carrier ခ. ခ (na) again appears in the ‘angular’ shape, though without its descender word-internally and in the abbreviation ခ *nay*. ခ (ta) comes with a horizontal stroke instead of a curl at the bottom; ခ (sa) gains a descender, as does ခ (ra). Not shown here either are changes to the ‘large’ diacritics.

## 3 Morphological typology

---

The first chapter dealt with the smallest constituent parts of words—speech sounds, which ones there are, and how they assemble into valid words. Consequently, the following two chapters will be about the next step up from this: morphemes, the atoms of meaning. First, we will have a more general look at which kinds of morphemes there are, and then look at them more closely by part of speech: what is their distribution, and how are morphemes put together to form inflected words? This chapter on morphological typology will first deal with general questions about Ayeri's degree of synthesis, and then will try to answer questions about the kinds of functions the various morpheme classes carry out in the language.

### 3.1 Typology

For the largest part, Ayeri is an *agglutinative* language. Comrie (1989) says of agglutinating languages that in these, typically,

a word may consist of more than one morpheme, but the boundaries between morphemes in the word are always clear-cut; moreover, a given morpheme has at least a reasonably invariant shape, so that the identification of morphemes in terms of their phonetic shape is also straightforward. [...] As is suggested by the term agglutinating (cf. Latin *gluten* 'glue'), it is as if the various affixes were just glued on one after the other (or one before the other, with prefixes). (43–44)

In Ayeri, root morphemes are modified by affixes for the purposes of inflection and derivation, and these affixes, in the form of suffixes more specifically, can be stacked, especially on verbs. Indeed, they vary little, so that they are always easily recognizable. Suffixation in Ayeri is especially prominent on verbs:

- (1) *Le kondasayāng hemaye pruyya nay napayya kayvay.*  
le kond-asa=yāng hema-ye-Ø pruy-ya nay napay-ya kayvay  
PT.INAN eat-HAB=3SG.M.A egg-PL-TOP salt-LOC and pepper-LOC without

'He always eats his eggs without salt and pepper.'

The verb root 𐌵𐌳𐌰: *kond-* ‘eat’ is inflected here for a habitual action with the suffix 𐌱𐌰𐌶 -*asa*, and also carries a pronominal clitic, 𐌶𐌵𐌰𐌶 -*yāng*, marking a third person singular masculine agent. With the notable exception of pronouns and related pronominal clitics, affixes tend to encode a single grammatical function. Verbs are not the only part of speech that can inflect; nouns, adjectives, and the relativizing conjunction can as well:

- (2) a. *Ang mətabanay tamanyeley yeyam.*  
 ang mə-tahan=ay.Ø taman-ye-ley yeyam.  
 AT PST-write=1SG.TOP letter-PL-P.INAN 3SG.F.DAT  
 ‘I wrote letters to her.’
- b. *Ang koronya Kaman apyanas palay-eng.*  
 ang koron-ya Kaman apyan-as palay-eng  
 AT know-3SG.M Kaman joke-P funny-COMP  
 ‘Kaman knows a funnier joke.’
- c. *Le turayāng taman sinā ang ningay tamala vās.*  
 le tura=yāng taman-Ø si-Ø-na ang ning=ay.Ø tamala vās  
 PT.INAN send=3SG.M.A letter-TOP REL-PT.INAN-GEN AT tell=1SG.TOP yesterday 2SG.P  
 ‘The letter which I told you about yesterday, he sent it.’

The principle of not conflating several grammatical functions into a single suffix can be observed in (2a) regarding the word 𐌳𐌵𐌰𐌶𐌵𐌰𐌶 *tamanyeley* ‘letters’, in which the plural marker 𐌵𐌰𐌶 -*ye* is distinct from the inanimate-patient case marker 𐌵𐌰𐌶 -*ley* (the latter, however, conflates animacy and case). Strictly speaking, the pronoun 𐌶𐌵𐌰𐌶 *yeyam* ‘to her’ is also composed, namely of the third person feminine base form 𐌶𐌵𐌰 *ye* and the dative case marker 𐌶𐌵𐌰 *yam*. Example (2c) is one we have already encountered before (p. 11). Here, the relative pronoun, 𐌱𐌰𐌶 *sinā* ‘of/about which’ is inflected for genitive case, and stress on the usually unstressed last syllable suprasegmentally marks that this form is contracted from 𐌱𐌰𐌶𐌵𐌰𐌶 *sileyena* (*si-ley-ena*, REL-P.INAN-GEN).

So far, we have concentrated on suffixes, but there are a number of prefixes as well; (2a) exhibits the past prefix 𐌵: *mə-* (which is actually redundant in this case). There are also demonstrative prefixes on nouns, however. In the following example, the prefix 𐌵𐌰𐌶: *eda-* ‘this-’ joins the noun 𐌶𐌵𐌰𐌶 *peham* ‘carpet’ to indicate a specific carpet.

- (3) *Le no intoyyang eda-peham.*  
 le no int-oy=yang eda=peham-Ø  
 PT.INAN want buy-NEG=1SG.A this=carpet-TOP  
 ‘I do not want to buy this carpet.’

Besides prefixes and suffixes, Ayeri also possesses at least one element in both the verb cluster and cooccurring with adpositions which straddles the border between inflection and a function word. This is the case with the clitic marker  $\text{ᄇᆞᆫ}$  *manga*, which is treated as an independent word, but can modify verbs and adpositions—heads of verb phrases (VPs) and prepositional phrases (PPs), respectively—is unstressed and appears at the margin of its modification target:

- (4) a. *Ang manga yavaya ayon bariley.*  
 ang manga yava-ya ayon-Ø bari-ley  
 AT PROG roast-3SG.M man-TOP meat-P.INAN  
 ‘The man is roasting meat.’
- b. *Ya mətapyyāng maritay misley manga luga bari.*  
 ya mə-tapy=yāng maritay mis-ley manga luga bari-Ø  
 LOCT PST-put=3SG.M.A before spit-P.INAN DIR between meat-TOP  
 ‘The meat, he had put a spit through it before.’

In (4a),  $\text{ᄇᆞᆫ}$  *manga* modifies the verb  $\text{ᄇᆞᆫ}$  *yava-* ‘roast’ and indicates that this is a temporarily ongoing action, like the English progressive, except not as strongly grammaticalized.<sup>1</sup> In (4b),  $\text{ᄇᆞᆫ}$  *manga* modifies the preposition, on the other hand, to indicate that it is directional:  $\text{ᄇᆞᆫ}$  *luga* by itself means ‘among, between’, while its directional form  $\text{ᄇᆞᆫ}$   $\text{ᄇᆞᆫ}$  *manga luga* means ‘through; during, for’.

As we have seen in the examples above, person suffixes on verbs are single morphemes that encode more than one property, for example  $\text{ᄇᆞᆫ}$  *-yeng* encodes the person features third person, feminine, singular, and agent. Personal pronouns, of which the person clitics on verbs are an instance, are the main case of fusion among agglutination in Ayeri, although some of the forms, like  $\text{ᄇᆞᆫ}$  *yeyam* ‘to her’ above, can be decomposed into root and suffix without problem.<sup>2</sup>

Perpendicular to the axis isolation–agglutination runs the axis analytic–synthetic. On the latter axis, Ayeri scores mostly as *synthetic*, since it prefers compactness over spreading a construction over several words, though it does not incorporate object noun phrases (NPs) and it is not possible to form ‘sentence-words’ either, so

<sup>1</sup> I suppose, a better parallel is the so-called *rheinische Verlaufsform* ‘Riparian progressive’ (*sein* ‘be’ + *am/beim* ‘at the’ + infinitive) in German, a construction common in the colloquial language which parallels the English progressive construction and is not yet fully grammaticalized (Eisenberg et al. 2016: 435). Speakers will thus accept both *Er lernt gerade*, literally ‘He studies right now’, and *Er ist am lernen* ‘He is studying’.

<sup>2</sup> Originally, Ayeri’s personal pronouns were indeed agglutinative as well, so  $\text{ᄇᆞᆫ}$  *yeng* ‘she’ used to be  $\text{ᄇᆞᆫ}$  *iyegang* (*iy-e-ang*, 3SG-F-A). This also gives an explanation to Boga et al. (2016)’s observation that Ayeri’s plural pronouns are formed “[v]ielleicht sogar zu regelmäßig” ([15]; ‘possibly in an even too regular way’).

it is not going so far as to be polysynthetic (Comrie 1989: 45–46). It is nonetheless theoretically possible, due to suffixation being a prominent pattern, to form foot-long words like

- (5) *da-mətabasongoyyang-ikan*  
 da=mə-taha-asa-ong-oy=yang=ikan  
 such=PST-have-HAB-IRR-NEG=ISG.A=much  
 ‘I would not much used to have had such’

Cases of analytic morphology are compound prepositions as we have seen with *ᄃᆞᆫᆫᆞᆫ manga luga* ‘through’ in (4b), but verbs as well show analytic structures not only with the progressive marker, but also with modals:

- (6) *Ming saboyyang dabas.*  
 ming saha-oy=yang dabas  
 can come-NEG=ISG.A today  
 ‘I can’t come today.’

Most of the information the VP contains in this example is marked on the content verb, *ᄃᆞᆫᆫᆞᆫ saba-* ‘come’, except for ability, which is expressed by the particle *ᄃᆞᆫᆫᆞᆫ ming* ‘can’. *ᄃᆞᆫᆫᆞᆫ ming* is an uninflected form of the verb expressing ability and we might count them as auxiliary verbs in that the full semantic content of the VP is spread out over two verb forms, one major, one minor—this probably should not be understood as a serial verb construction, however (Aikhenvald 2006).<sup>3</sup> As we will see later (section 3.2.5), though, these modal particles behave more like clitics than function words. Consider, on the other hand, the following example in which *ᄃᆞᆫᆫᆞᆫ ming* is inflected like a regular verb:

- (7) *Da-mingya ang Diyan.*  
 da=ming-ya ang Diyan.  
 so=can-3SG.M A Diyan  
 ‘Diyan can (do it).’

## 3.2 Morphological processes

### 3.2.1 Prefixation

Prefixes in Ayeri apply mainly to verbs, but nouns, pronouns, adjectives and conjunctions as well can appear with them, some of which are likely clitics; reasons

<sup>3</sup> *ᄃᆞᆫᆫᆞᆫ manga* has, in fact, a verbal counterpart *ᄃᆞᆫᆫᆞᆫ manga-* ‘move; remove’ as well, which presumably served as the origin of both the progressive and the directional marker.

for their being clitics will be discussed below in section 3.2.5. With verbs, prefixes that are most certainly ‘true’ prefixes—that is, bound morphemes that have been semantically bleached by grammaticalization to the point where they only express grammatical functions (Lehmann 2015: 157 ff.) and which subcategorize words rather than phrases (Klavans 1985: 117), with a rather high obligation to be marked on every conjunct in coordination (Spencer and Luís 2012: 139)—are the tense prefixes marking both three degrees of past and future tense, for example:

- (8) *Ang səsarāyn ya Makapetang.*  
 ang sə-sara=ayn.Ø ya Makapetang  
 AT FUT-go=IPL.TOP LOC Makapetang  
 ‘We will go to Makapetang.’

Here, the prefix ꠘ: sə- marks future tense on the verb, ꠘꠘ: sara- ‘go’. The other tense prefixes are ꠘꠘ: kə- (NPST), ꠘ: mə- (PST), ꠘꠘ: və- (RPST), and ꠘ: pa- (NFUT) and ꠘꠘ: ni- (RFUT). Besides this set of prefixes, there are also a number of proclitics that can appear with verbs, though not exclusively. These are the anaphora ꠘꠘ: da- ‘thus, so, such’ and the reflexive marker ꠘꠘꠘ: sitang- ‘self’:

- (9) *Da-mingya ang Diyan.*  
 da=ming-ya ang Diyan.  
 so=can=3SG.M A Diyan  
 ‘Diyan can (do it).’

- (10) *Sitang-kecāng.*  
 sitang=ket=yāng  
 self=wash=3SG.M.A  
 ‘He washes himself.’

ꠘꠘꠘ: sitang- can also be used as a preverbal particle in situations where the agent is also the instrument, so both of the following two sentences are equivalent in meaning:

- (11) a. *Sa apicāng nanga ikan sitang-yari.*  
 sa apit=yāng nanga ikan sitang=yari  
 PT clean=3SG.A house complete self=3SG.M.INS  
 ‘He cleaned the whole house by himself.’  
 b. *Sa sitang-apicāng nanga ikan.*  
 sa sitang=apit=yāng nanga ikan  
 PT self-clean=3SG.A house complete  
 (idem)

Example (11a) shows the more common application of *sitang-*, that is, as a reflexive modifier of pronouns. The prefix *da-* can as well be used with noun phrases and is part of the demonstrative set of prefixes (which behave, in fact, like proclitics), *da-* ‘such’, *eda-* ‘this’, and *ada-* ‘that’:

- (12) *eda-* / *ada-* / *da-ganang*  
*eda=* / *ada=* / *da=gan-ang*  
 this= / that= / such.a=child-A  
 ‘this/that/such a child’

The demonstrative prefixes are also used to form the demonstrative pronouns *edanya* ‘this one’, *adanya* ‘that one’ and *danya* ‘such one’. A special case in this regard is the postposition *da-nārya* ‘in spite of, despite’ where *da-* combines with the conjunction *nārya* ‘but, although, except’. Originally, *dikapisa* ‘respective’ is derived from *da-* + *ikapisa* ‘bound, dependent’, which is an example of a combination with an adjective. There is also a fixed adverbial expression using one of these prefixes, *eda-tadayyam* ‘for the time being, for now’ (this=time-DAT).

Last but not least, the prefix *ku-* ‘like, as though’ (also a proclitic) can be used with both adjectives and nouns, as well as complement phrases:

- (13) a. *ku-koyaya*  
           *ku=koya-ya*  
           like=book-LOC  
           ‘like in a book’  
       b. *ku-prasi*  
           *ku=prasi*  
           like=sour  
           ‘as though (it were) sour’  
       c. *ku-adareng*       *turavangas*  
           *ku=ada-reng*     *turavang-as*  
           like=that-A.INAN problem-P  
           ‘as though that were a problem’

An example of a set-phrase adverbial consisting of *ku-* and a verb is *ku-nasya* ‘as follows’, *nasya-* meaning ‘follow’. What is curious here is that this fossilized form is lacking person marking and is just extended with an epenthetic *-a* since *-sy* is not a permissible coda. The expected form would be *\*ku-nasyareng* (like-follow=3SG.INAN.A).

Following Klavans (1985), who suggests that clitics best be defined as “affixation at the phrasal level” (117), a very common kind of prefix to the verb *phrase* are the

topic markers. They are counted as parts of the VP but do not interact with it regarding stress assignment (they are always unstressed) while always being in an initial position, preceding any other preverbal elements:

- (14) a. *Ang tabanya tamanley.*  
           ang tahan-ya taman-ley  
           AT write-3SG.M letter-P.INAN  
           ‘He writes a letter.’  
       b. *Ang mətabanya tamanley.* ‘He wrote a letter.’  
       c. *Ang manga mətabanya tamanley.* ‘He was writing a letter.’  
       d. *Ang manga no mətabanya tamanley.* ‘He was wanting to write a letter.’

### 3.2.2 Suffixation

As a largely agglutinative language, most grammatical marking in Ayeri is done by means of suffixes. These occur mainly with nouns and verbs, however, some basic quantifiers take the shape of suffixes as well, but behave more like enclitics. Quantifiers may modify content words almost regardless of their part of speech—noun, verb, adjective or adverb. The most pervasive examples of suffixation are certainly those of case marking on nouns and of person marking on verbs, for example:

- (15) *Sa pəharuyang va manga miday tangya vana suyareri, vimyon!*  
       sa pə-haru=yang va.Ø manga miday tang-ya vana suyar-eri vimyon  
       PT NFUT-beat=1SG.A 2SG.TOP DIR around ears-LOC 2SG.GEN ladle-INS monkey  
       ‘I’ll beat you around your ears with a ladle, you monkey!’

This example shows marking of 𐌂𐌆𐌇 *tang* ‘ears’ with the locative case suffix 𐌇𐌆𐌇 -*ya* and the marking of 𐌂𐌆𐌇 *suyar* ‘ladle’ with the instrumental case suffix 𐌇𐌆𐌇 -*eri*; the previous examples already provide instances of the exceedingly common markers for agent and patient case, 𐌂𐌆𐌇 -*ang* and 𐌂𐌆𐌇 -*as*, respectively. Besides case, nouns can also be marked for plural with the suffix 𐌇𐌆𐌇 -*ye*, and verb roots may be extended by the mood and aspect markers 𐌇𐌆𐌇 -*ong* (IRR), 𐌇𐌆𐌇 -*asa* (HAB) and 𐌇𐌆𐌇 -*oy* (NEG), the last of which is the most frequently occurring one. The mood suffixes can also be stacked, leading to the long word in (5) above. Person marking on verbs is realized as agreement suffixes or of clitic personal pronouns depending on whether an agent NP proper is present or not for the verb to agree with. In (15), a cliticized agent pronoun 𐌇𐌆𐌇 -*yāng* ‘he’ (3SG.M.A) appears.

As mentioned above, quantifiers appear as enclitics on almost any type of content word, like on the adverb 𐌂𐌆𐌇 *para* ‘fast’ in the following example:

- (16) *Tigalyeng para-ma.*  
 tical=yeng para=ma  
 swim=3SG.F.A fast=enough  
 ‘She swims fast enough.’

### 3.2.3 Reduplication

There are two patterns of reduplication for verbs, one with complete reduplication of the imperative form to create a hortative statement (17a), and one with partial reduplication as a way to express that an action takes place again, that is, partial reduplication expresses a iterative, as it were (17b). The imperative iterative, then, has a hortative function as well (17c):

- (17) a. *naru-naru*  
 naru~nara-u  
 HORT~speak-IMP  
 ‘let us speak’  
 b. *na-narayeng*  
 na~nara=yeng  
 ITER~speak=3SG.F.A  
 ‘she speaks again’  
 c. *na-naru*  
 na~nara-u  
 ITER~speak-IMP  
 ‘let us speak again’

With nouns, full reduplication is used to create a diminutive form (18a), though some reduplications are also lexicalized and may use roots from other parts of speech as well to form nouns, for instance, the words in (18b–d). There are also a number of adjectives for which there exists a lexical reduplication with an intensifying meaning; (19) lists a few examples. This, however, is not a productive derivation strategy.

- (18) a. *veney* ‘dog’ → *veney-veney* ‘little dog, doggie’  
 b. *gan* ‘child’ → *gan-gan* ‘grandchild’  
 c. *kusang* ‘double (adj.)’ → *kusang-kusang* ‘model’  
 d. *veh-* ‘build’ → *veha-veha* ‘tinkering’  
 (19) a. *apan* ‘wide’ → *apan-apan* ‘extensive’  
 b. *kebay* ‘alone’ → *kebay-kebay* ‘all alone’  
 c. *pisu* ‘tired’ → *pisu-pisu* ‘exhausting’

### 3.2.4 Suprasegmental modification

As written above (section 1.1.2), case agreement on a complex-marked relative pronoun can drop out under certain circumstances and is replaced by compensatory stress on the secondary case marker, which lengthens the syllable's nucleus vowel:

- (20) ... *tamanley sinā* (\**sina*) *ang ningay tamala vās*  
 ... [taman-ley]<sub>1</sub> si-Ø<sub>1</sub>-na (\*si-na<sub>1</sub>) ang ning=ay.Ø tamala vās  
 ... letter-P.INAN REL-PT.INAN-GEN (\*REL-GEN) AT tell=1SG.TOP yesterday 2SG.P  
 '... the letter which (\*whose) I told you about yesterday'

This can be reinterpreted so that vowel length/stress itself is what signifies the agreement of the relativizer with the preceding NP. Which grammatical role the relativizer's head figures as an agreement controller is essentially underspecified, hence I will gloss it as -AGR in the following example instead of as full -P.INAN:

- (21) /si.lei.'ena/ → /si.'na(:)/  
 /si-lei-ena/ → /si-'-na(:)/  
 REL-P.INAN-GEN REL-AGR-GEN

Since  $\text{na}$  as a light syllable cannot be stressed in word-final position under normal circumstances, it has to lengthen to  $\text{nā}$ .

### 3.2.5 Clitics

I have been using the term 'clitic' above and claimed that the one or the other morpheme in Ayeri is a clitic. Clitics, however, cannot be easily defined in a formal way, as it appears (Spencer and Luís 2012: 126). Based on Spencer and Luís (2012), with recourse to Zwicky and Pullum (1983), some typical characteristic traits are:

- Clitics behave in part like function words and in part like affixes, but in any case they are not free morphemes (Spencer and Luís 2012: 38, 42).
- Clitics tend to be phonologically weak items (39).
- Clitics prominently—and importantly—tend to attach 'promiscuously' to surrounding words. That is, unlike inflection, they are not limited to connect to a certain part of speech or to align with their host in semantics (40, 108–109).
- Clitics tend to appear in a second position, whether that is after a word, or an intonational or syntactic phrase (41).
- Clitics tend to be templatic and to cluster, especially if they encode inflection-like information (41, 47–48).
- Clitics have none of the freedom of ordering found in independent words and phrases (43).
- Positions of 'special' clitics tend to not be available to free words (44).

- Clitics tend to be functional morphemes, and to realize a single morphosyntactic property (Spencer and Luís 2012: 67, 179).
- There are no paradigmatic gaps (108–109).
- There tends to be no morphophonemic alteration like vowel harmony, stress shift or sandhi between a clitic and its host (108–109).
- There tends to be no idiosyncratic change in meaning when a clitic and a clitic host come together, unlike there may be with inflection (108, 110).
- Similar to affixes, clitics and their host tend to be treated as a syntactic unit, that is, lexical integrity prevents that word material can be put in between a clitic and its host (108, 110).
- Clitics usually get joined to a host word after inflection (108, 110).
- Affixes tend to go on every word in a conjunct (narrow scope), while clitics have a tendency to treat a conjunct as a unit to attach to (wide scope; 139, 196 ff.).

However, Spencer and Luís (2012) point out many counterexamples to this list in order to highlight that the border between clitics and affixes is often fuzzy. Given this fuzziness, it comes as no surprise that according to their assessment, there is a lot of miscategorization in individual grammars as a result (107). Another consequence of this lack of a clear delineation between clitics and affixes is that, since not all of the traits described above are always present, making a checklist and summing up the tally is only of limited value. The traits listed above are thus sufficient conditions only, not necessary ones. In the following, I want to elaborate on the classification of various prefixes, suffixes, and particles as clitics.<sup>4</sup>

#### *Preposed particles and prefixes*

What should be rather unproblematic with regards to classification as clitics in Ayerí are the preverbal particles, that is, the topic marker, one or several modal particles, the progressive marker, and also the emphatic affirmative and negative discourse particles. All of these particles essentially have functional rather than lexical content, and are usually unstressed. They come in a cluster with a fixed order, and they appear in a position where no ordinary word material could go,

<sup>4</sup> The following discussion incorporates most of the content of a blog article I previously wrote on this topic, Becker (2017), with some additions and corrections. Since clitics sit at the junction of morphology and syntax, it will be necessary at times to deal with topics roughly which will be elaborated on later in more detail.

since Ayeri is strictly verb-initial.<sup>5</sup> In conjuncts it is also unnecessary to mark every verb with one or several preverbal particles:

- (22) a. *Ang kece            nay dayungisaye   māva            yanjas   yena.*  
 ang ket-ye        nay dayungisa-ye   māva-Ø        yan-ye-as   yena  
 AT wash-3SG.F and dress-3SG.F mother-TOP boy-PL-P 3SG.F.GEN  
 ‘The mother washes and dresses her boys.’
- b. *Manga sahaya        rangya        nay nedraya   ang Tikim.*  
 manga saha-ya        rang-ya        nay nedra-ya   ang Tikim  
 PROG come-3SG.M home-LOC and sit-3SG.M A Tikim  
 ‘Tikim is coming home and sitting down.’
- c. *Ang mya            ming sidegongya            nay la-lataya*  
 ang mya            ming sideg-ong=ya.Ø        nay la~lata=ya.Ø  
 AT be.supposed.to can repair-IRR=3SG.M.TOP and ITER~sell=3SG.M.TOP  
*ajamyeley.*  
 ajam-ye-ley  
 toy-PL-P.INAN  
 ‘He should be able to repair and resell the toys.’

In (22a), therefore, the agent-topic marker *ang* only occurs before *kece* ‘(she) washes’, and the conjoined verb *dayungisaye* ‘(she) dresses’ is also within its scope. Repeating the marker as well before the latter verb could either be considered ungrammatical because there is only one topic there—*māva* ‘mother’—or the sentence could be interpreted as having two conjoined clauses with different subjects: ‘[She washes] and [mother dresses] her boys.’ The latter outcome has *māva* as the topic only of *dayungisaye*, while *kece*’s topic is the person marking on the verb—a pro-drop subject, essentially.<sup>6</sup>

In (22b), then, the progressive marker *manga* equally has scope over both verb conjuncts, *sahaya* ‘(he) comes’ and *nedraya* ‘(he) sits’ in what is presumably a case of extended/distributed exponence. This is to say that functionally contiguous information can sometimes be split over several words, so that the functional annotation of each verb in (22b) can be represented in the fashion of the (incomplete) f-structure matrix (see Bresnan et al. 2016; Butt and King 2015) shown in (23), which is an attempt to represent the phrase *ang manga saha-* ‘is coming’ formally. *ang manga* is treated there as being part of things the verb inflects for, that is, progressive aspect, in spite of appearing superficially as a

<sup>5</sup> The translation of ‘Ozymandias’ in section B.3 deviates from this rule in *ḡamāng sam kāryo nay taryankay bengyon adābalya*. ‘Two big and torsoless legs stand in that desert’ by having the subject NP *ḡamāng sam* ... ‘two legs ...’ precede the verb *bengyon* ‘(they) stand’. This is non-standard syntax in a poetic text.

<sup>6</sup> This claim is further investigated below, p. 89 ff.; also compare section 4.5.1.

function word. The topic marker ၵၵၵ *ang* does not reflect a morphological property of the verb in the way the progressive marker does, but announces the case and—for agents and patients—the animacy value of the topicalized noun phrase (NP), so the f-structure in (23) lists this information under the TOP relation.<sup>7</sup>

(23)	<table> <tr> <td>PRED</td><td>'come &lt;((↑ SUBJ), (↑ OBL<sub>loc</sub>))&gt;'</td></tr> <tr> <td>ASP</td><td>PROG</td></tr> <tr> <td>TOP</td><td> <table> <tr> <td>CASE</td><td>A</td></tr> <tr> <td>ANIM</td><td>+</td></tr> <tr> <td>...</td><td>...</td></tr> </table> </td></tr> <tr> <td>...</td><td>...</td></tr> </table>	PRED	'come <((↑ SUBJ), (↑ OBL <sub>loc</sub> ))>'	ASP	PROG	TOP	<table> <tr> <td>CASE</td><td>A</td></tr> <tr> <td>ANIM</td><td>+</td></tr> <tr> <td>...</td><td>...</td></tr> </table>	CASE	A	ANIM	+	...	...	...	...

Modal particles, exemplified in (22c), are probably slightly less typical as clitics since it seems feasible for them to be stressed for contrast. What is not possible, however, is to front either ၵၵ *mya* 'be supposed to' or ၵၵၵ *ming* 'can', and the verb itself also cannot precede the particles, which is demonstrated in (24). It is also not possible to coordinate any of the elements in the preverbal particle cluster with ၵၵ *nay* 'and', as shown in (25).

- (24) a. \**mya ang ming sidegongya*  
 b. \**ming ang mya sidegongya*  
 c. \**sidegongya ang mya ming*
- (25) a. \**ang nay mya ming sidegongya*  
 b. \**ang mya nay ming sidegongya*  
 c. \**ang mya ming nay sidegongya*

It needs to be pointed out that unlike verbs, modal particles in Ayeri resist inflection, so in (22c) the irrealis suffix ၵၵၵ *-ong* is realized on the verb ၵၵၵ *sidegongya* '(he) would repair' instead of on one or both of the modal particles as \**ၵၵၵ ၵၵၵ* \**mingong* and \**ၵၵၵ ၵၵၵ* \**myong*, respectively. The combination of ၵၵ *mya* 'be supposed to' with an irrealis-marked verb together indicates that the speaker thinks the action denoted by the verb *should* be carried out. The marking on the verb may then be interpreted as distributing to the constituent parts of whole verb complex. The same goes for negation: only the verb can be negated, but not the modal particle. Possibly, it would be useful in this case to abstract the modal particles as a

<sup>7</sup> In the chart, angular brackets group grammatical functions together. Since the verb is basically the head of the clause, the first PRED (predicator) lists the verb with its argument structure (a-structure). In the case of (23), (↑ SUBJ) and (↑ OBL<sub>loc</sub>) indicate that the verb, 'come', governs two arguments: one syntactic subject and one oblique argument in the form of a locative adverbial, which have been omitted for brevity in the chart.

feature [MODALITY] as listed by ParGram (2009–2016: Feature Table) for purposes of functional representation. At least superficially, it looks as though Ayeri acts differently from English here in that the content verb is possibly not a complement of the modal element. This assumption is supported by the fact that in Ayeri, the verb inflects, not the modal particle. Furthermore, modal particles cannot be modified by adverbs in the way regular verbs can:

- (26) a. *Ming tigalye ban nilay ang Diya.*  
 ming tigal-ye ban nilay ang Diya  
 can swim-3SG.F good probably A Diya  
 ‘Diya can probably swim well.’
- b. \**Ming nilay tigalye ban ang Diya.*  
 ming nilay tigal-ye ban ang Diya  
 can probably swim-3SG.F well A Diya

Combinations of topic particle and modal particle, as well as modal particle and verb, can likewise not be interrupted by parenthetical material like *naratang* ‘they say’, so that:

- (27) a. *Naratang, ang ming tigalye ban Diya kodanya.*  
 nara=tang ang ming tigal-ye ban Ø Diya kodan-ya  
 say=3PL.M.A AT can swim-3SG.F well TOP Diya lake-LOC  
 ‘They say Diya can swim well in a lake.’
- b. \**Ang naratang, ming tigalye ban Diya kodanya.*
- c. \**Ang ming, naratang, tigalye ban Diya kodanya.*
- d. ?*Ang ming tigalye, naratang, ban Diya kodanya.*
- e. *Ang ming tigalye ban, naratang, Diya kodanya.*
- f. *Ang ming tigalye ban Diya, naratang, kodanya.*
- g. *Ang ming tigalye ban Diya kodanya, naratang.*

Besides verbs, nouns as well have preposed modifiers. This is the case with proper nouns specifically, where the name is preceded by a case particle instead of receiving a case-marking suffix like generic nouns do. This case marker is phonologically weak in that its phonological make-up is similar to that of affixes, and unstressed, with the exception of the causative case marker *sā*, which bears at least secondary stress since it contains a long vowel. We already saw case particles preceding names in (22b) and (26) above: *ang Tikim* and *ang Diya*; *ang* marks the proper-noun NPs as agents in both cases. The case marker is missing when the NP is topicalized, as indicated in (27), where the agent NP appears as just *Diya*, not *ang Diya*. While case suffixes have narrow scope as shown in (28a) and thus need to be repeated on every NP in a conjunct, preposed case

markers as that in (28c) may be used with wide scope if both conjuncts are proper nouns. Narrow scope with proper nouns may add an individuating connotation, exemplified by (28d).

- (28) a. *Toryon veneyang nay badanang.*  
 tor-yon veney-ang nay badan-ang  
 sleep-3PL.N dog-A and father-A  
 ‘The dog and father are (both) sleeping.’
- b. \**Toryon veney nay badanang.*  
 tor-yon veney\_ nay badan-ang  
 sleep-3PL.N dog\_ and father-A
- c. *Sa sobisayan ang Niva nay Mico narānye.*  
 sa sobisa-yan ang Niva nay \_ Mico narān-ye-Ø  
 PT study-3PL.M A Niva and \_ Mico language-PL-TOP  
 ‘Languages is what Niva and Mico study.’
- d. *Sa sobisayan ang Niva nay ang Mico narānye.*  
 sa sobisa-yan ang Niva nay ang Mico narān-ye-Ø  
 PT study-3PL.M A Niva and A Mico language-PL-TOP  
 ‘Languages is what Niva and Mico (each) study.’

Taking the above characteristics into account—inability to insert word material, special positioning, and wide scope—one may argue that the preposed case markers are clitics. It should be noted furthermore that a single NP cannot be marked for two grammatical functions at the same time, so that case markers cannot be coordinated, as is attempted in (29a) below with \* $\text{ᠰᠠ ᠨᠠᠶ ᠰᠠ}$  *\*sa nay sã Sopan*:

- (29) a. \**Ang delacan sa nay sã Sopan.*  
 ang delak=yan.Ø sa nay sã Sopan  
 AT suffer.from=3PL.M.TOP P and CAUS Sopan  
 Intended: ‘They suffer from and due to Sopan.’
- b. *Ang delacan sa Sopan, nay yasa.*  
 ang delak=yan.Ø sa Sopan nay yasa  
 AT suffer.from=3PL.M.TOP P Sopan and 3SG.M.CAUS  
 ‘They suffer from Sopan, and due to him.’

The case markers of proper nouns are necessarily proclitics rather than enclitics to preceding word material, since it is possible for them to begin utterances, where it is not possible to lean to the left, but only to the right. This is the case in equative sentences such as the one in (30a). In these cases as well, it is not possible for parenthetical material to be placed between the case marker and its target of modification, as in (30b); the particle and its head cohere closely and behave essentially like a unit.

- (30) a. *Ang Misan lajāyas puti.*  
 ang Misan lajāy-as puti  
 A Misan student-P zealous  
 ‘Misan is a zealous student.’
- b. \**Ang paronyang, Misan lajāyas puti.*  
 ang paron=yang Misan lajāy-as puti  
 A believe=1SG.A Misan student-P zealous

The fact that case particles attach always to a proper noun very specifically makes them unlike ‘typical’ clitics, since according to Spencer and Luís (2012), a typical and important feature of clitics is their ‘promiscuous’ attachment, as described initially. This puts case particles closer to affixes—just like the suffixed case markers. On the other hand, as previously pointed out, clitics do not have to exhibit all traits often associated with them in order to be counted as such. Yet more typical of function words, on the other hand, is the fact that there is no morphophonemic interaction between a case particle and the word it modifies. Thus, for instance, there is no form /sa:dʒa:n/ resulting from the combination of ꨀ *sa* (P) with ꨀꨀꨀꨀ *Ajān*. This overlap in form between affix and function word is typical of clitics, according to the traits excerpted from Spencer and Luís (2012) above.

As discussed previously, ꨀꨀ *manga* may not only modify verbs, but also adpositions—which in the case of prepositions are often very transparently derived from nouns. ꨀꨀ *manga* in combination with an adposition indicates that there is motion along a path. The directional marker ꨀꨀ *manga* is thus a functional morpheme and it always appears before the adposition itself. Adpositions do not otherwise inflect, but ꨀꨀ *manga*, due to its functional nature, could reasonably be construed as inflection, in spite of appearing as a function word, just as its (related) verbal counterpart. This double nature makes it a good candidate for a clitic. Applying a shuffling or coordination test here to figure out whether ꨀꨀ *manga* is an adjunct is moot, since there is nothing else which can appear in this position—the position ꨀꨀ *manga* appears in is thus syntactically privileged; ꨀꨀ *manga* can be said to exhibit special syntax, which is further evidence for it being a clitic. With regards to the distinction between special and simple clitics (Zwicky 1977), it ought to be classified as the former, since even though it may be derived from the verb ꨀꨀ: *move*, this verb does not constitute the particle’s associated full form:

- (31) a. *Ang saraya Ajān manga kong nangaya.*  
 ang sara-ya Ajān manga kong nanga-ya  
 AT go-3SG.M Ajān DIR inside house-LOC  
 ‘Ajān goes into the house.’

- b. <sup>1</sup> *Ang saraya mangayam Ajān kong nangaya.*  
 ang sara-ya manga-yam Ajān kong nanga-ya  
 AT go-3SG.M move-PTCP Ajān inside house-LOC  
 ‘Ajān goes to move inside the house.’

Example (31b) assumes that the hypothetical correct place of the verb *ᳵ᳚᳚᳚* *manga* ‘move’ to appear in is as an infinite complement to the main verb in the sentence, *ᳵ᳚᳚᳚* *sara* ‘go’. While not ungrammatical *per se*, the sentence would imply that *ᳵ᳚᳚᳚* *Ajān* walks away in order to move around in the house, which is not what (31a) posits. There is thus no direct semantic relationship between what we assumed to be the historical full form and the grammatical marker, that is, the full verb and the directional particle cannot be used interchangeably. When testing with parenthetical word material, it becomes clear that *ᳵ᳚᳚᳚* *manga kong* ‘into’ forms a syntactic unit, which is demonstrated in (32). *ᳵ᳚᳚᳚* *manga* is a bound morpheme, and thus not a function word proper.

- (32) a. *Ang saraya Ajān, narayāng, manga kong nangaya.*  
 ang sara-ya Ajān nara=yāng manga kong nanga-ya  
 AT go-3SG.M Ajān say=3SG.M.A DIR inside house-LOC  
 ‘Ajān goes, he says, into the house.’  
 b. \**Ang saraya Ajān manga, narayāng, kong nangaya.*  
 c. *Ang saraya Ajān manga kong, narayāng, nangaya.*

Also, when testing *ᳵ᳚᳚᳚* *manga*’s behavior in terms of distribution over coordinated NPs, we can see in (33b) that there is no problem in condensing the sentence given in (33a) to the extent that *ᳵ᳚᳚᳚* *manga* governs two adpositions in coordination—*ᳵ᳚᳚᳚* *miday* ‘around’ and *ᳵ᳚᳚᳚* *kong* ‘inside’—sharing the same adpositional object, *ᳵ᳚᳚᳚* *nanga* ‘house’.

- (33) a. *Ang saraya Ajān manga miday nangaya nay manga kong nangaya.*  
 ang sara-ya Ajān manga miday nanga-ya nay manga kong nanga-ya  
 AT go-3SG.M Ajān DIR around house-LOC and DIR inside house-LOC  
 ‘Ajān goes around the house and into the house.’  
 b. *Ang saraya Ajān manga miday nay kong nangaya.*  
 ang sara-ya Ajān manga miday nay kong nanga-ya  
 AT go-3SG.M Ajān DIR around and inside house-LOC  
 ‘Ajān goes around and into the house.’

For all intents and purposes, thus, *ᳵ᳚᳚᳚* *manga* behaves syntactically like a typical clitic in that it has wide scope over conjuncts, coheres tightly with its target of modification, is located in a syntactically privileged position, and unites properties of both function words and inflection.

From this discussion of prenominal (and one pre-adpositional) particles, let us return to verbs again for a moment. Besides the preverbal particles discussed above, there is also what is spelled as a prefix on the verb which appears to be a little odd as such in that it can have wide scope over conjoined verbs. This is the prefix 𐀓 *da-* often meaning ‘so, thus’, displayed in (34).

- (34) *Ang da-pinyaya nay hisaya Yan sa Pila.*  
 ang da=pinya-ya nay hisa-ya Ø Yan sa Pila  
 AT so=ask-3SG.M and beg-3SG.M TOP Yan P Pila

‘Yan asks and begs Pila to (do so).’

𐀓 *da-*, where it is not used for presentative purposes,<sup>8</sup> is a functional morpheme in that it basically acts as an anaphora for a complementizer phrase (CP) the speaker chooses to drop. Thus, it does not mark any of the intrinsic morphological categories of the verb (tense, aspect, mood, modality, finiteness), just like the topic marker refers to a syntactic relation the verb subcategorizes but none of its proper categories of inflection. As an anaphora, 𐀓 *da-* cannot stand alone, though it is possible to use a full demonstrative form 𐀓𐀕𐀗 *danya* ‘such one’ in its place:

- (35) *Ang pinyaya nay hisaya Yan sa Pila danyaley.*  
 ang pinya-ya nay hisa-ya Ø Yan sa Pila danya-ley  
 AT ask-3SG.M and beg-3SG.M TOP Yan P Pila such.one-P.INAN

‘Yan asks and begs Pila such.’

Unlike the preverbal particles, 𐀓 *da-* can be associated with a full form, though it still displays special syntax in that unlike English *-n’t* or *’ll*, for instance, it does not occur in the same place as the full form. Note also how 𐀓 *da-* is appended to the right of tense prefixes, which *do* express a property of the verb, as shown in (36).

- (36) a. *Ang da-məpinyaya sa Pila.*  
 ang da=mə-pinya=ya.Ø sa Pila  
 AT SO=PST=ask=3SG.M.TOP P Pila  
 ‘He asked Pila to.’  
 b. *Ang da-məpinyaya nay məhisaya Yan sa Pila.*  
 ang da=mə-pinya-ya nay mə-hisa-ya Ø Yan sa Pila  
 AT SO=PST=ask-3SG.M and PST-beg-3SG.M TOP Yan P Pila  
 ‘Yan asked and begged Pila to.’

<sup>8</sup> Although this use is probably related to the anaphoric use.

The verb form in (36) becomes ungrammatical with the order of its prefixes reversed, so it is not acceptable to say: မာ်ဒါပိယာ *məda-pinyaya*, although note that pre- and suffixes proper also have a fixed order in Ayeri, so this alone is probably not enough evidence to claim that မာ် *da-* is not possibly a prefix. Furthermore, while the tense prefixes undergo crasis, this is not the case with မာ် *da-*:

- (37) a. *Māmangreng.*  
           mə-amang=reng  
           PST-happen=3SG.INAN.A  
           ‘It happened.’  
       b. \**Məamangreng.*
- (38) a. *Da-amangreng.*  
           da=amang=reng  
           thus=happen=3SG.INAN.A  
           ‘It happens thus.’  
       b. \**Dāmangreng.*

Besides the characteristic of not seeking out certain parts of speech, the မာ် *da-* prefix satisfies the criteria of being a phonologically reduced form of an otherwise free functional morpheme, and it occurs in a place where normal syntax would not put its corresponding full form. It has wide scope over conjuncts, is attached outside of inflection for proper categories of the verb, and doesn’t interact with its host with regards to morphophonemics. In addition to these more typical traits of clitics, there is also no way to place words between မာ် *da-* and the verb stem:

- (39) *Da, naratang, amangreng.*  
       da  nara=tang  amang=reng  
       thus say=3PL.M.A  happen=3SG.INAN.A

The prefix မိတာ် *sitang-* ‘self’ behaves in the same way as မာ် *da-*, since it also abbreviates a reflexive NP, for instance, မိတာ်ယေ *sitang-yes* ‘herself’ where ‘herself’ as a patient is coreferential with the agent of the clause. One might assume that reflexivity is a verbal category of inflection in Ayeri, although, on the other hand, Ayeri also does not have any verbs which appear as grammatically reflexive to indicate anticausativity like in Romance languages. The reflexive marking in Ayeri is thus semantically motivated, not functionally.

- (40) a. *Adruara  biratayreng.*  
           adru-ara  biratay-reng  
           break-3SG.INAN  pot-A.INAN  
           ‘The pot broke.’

- b. \**Sitang-adruara biratayreng.*  
 sitang=adru-ara biratay-reng  
 self=break-3SG.INAN pot-A.INAN

*Intended:* ‘The pot broke.’ (an unspecified force broke it)

(41) French:

- a. *Le pot s’est cassé.*  
 le pot se=est cassé  
 the pot self=be.3SG.PRS broken

‘The pot broke.’ (an unspecified force broke it)

- b. *Le pot est cassé.*  
 le pot est cassé  
 the pot be.3SG.PRS broken

‘The pot is broken.’

Ayeri has a tendency to reuse prefixes with different parts of speech, and thus 𑌎 *da-* is also used with nouns, forming part of the series of deictic prefixes, 𑌎 *da-* ‘such (a)’, 𑌎 *eda-* ‘this’, 𑌎 *ada-* ‘that’. The prefix in all these cases represents a grammatical function, is unstressed, and may have wide scope over conjoined NPs, unless an individuating interpretation is intended, as in (42b). These traits are typical of clitics, as we have seen, though (43) shows that unlike with verbs, the deictic prefixes do undergo crasis here, which is a trait more typically associated with affixes.

- (42) a. *Sinyāng eda-ledanas nay viretāyās tondayena-ben?*  
 sinyā-ang eda=ledan-as nay viretāya-as tonday-ena=hen  
 who-A this=friend-P and supporter-P art-GEN=all

‘Who is this friend and supporter of all arts?’

- b. *Sinyāng eda-ledanas nay eda-viretāyās tondayena-ben?*  
 sinyā-ang eda=ledan-as nay eda=viretāya-as tonday-ena=hen  
 sinyā-A eda=ledan-P nay eda=viretāya-P tonday-GEN=hen

‘Who is/are this friend and this supporter of all arts?’

- (43) *Sa ming nelnang edāyon.*  
 sa ming nel=nang eda=ayon-Ø  
 P can help=IPL.A this=man-TOP

‘This man, we can help him.’

The deictic prefixes also cannot be used with all types of NPs, only with those headed by generic and proper nouns; the picky nature of the deictic prefixes also makes them more typical of affixes than of clitics. The preverbal particles, on the

other hand, also only occur with verbs, and it was nonetheless argued for them to be classified as clitics above due to the presence of other traits which make the particle under scrutiny clitic-like.

As mentioned initially, Spencer and Luís (2012) give numerous counterexamples to the catalog of traits typically associated with clitics. One of these counterexamples is what they call ‘suspended affixation’. This phenomenon occurs in Turkish, for instance, where the plural suffix *-ler* and subsequent suffixes can be left out in coordination (44a), as well as case markers (44b), and adverbials with case-like functions (44c):

(44) Turkish (Spencer and Luís 2012: 199):

- a. *bütün kitap(...) ve defter-ler-imiz*  
all book and notebook-PL-IPL.POSS  
‘all our books and notebooks’
- b. *Vapur hem Napoli(...) hem Venedik’e uğruyormuş*  
boat and Naples and Venice-LOC stops.EVID  
‘Apparently the boat stops at both Naples and Venice’
- c. *öğretmen-ler(...) ve öğrenci-ler-le*  
teacher-PL and student-PL-WITH  
‘with (the) students and (the) teachers’

Spencer and Luís (2012) note that, in “the nominal domain especially, wide scope inflection is widespread in the languages of Eurasia, becoming more prominent from west to east,” and that wide scope affixation “can be found with inflectional and derivational morphology in a number of languages, and it is often a symptom of recent and not quite complete morphologization” (200). They report further that Wälchli (2005) finds that suspended affixation is especially common with ‘natural coordination’, that is, the combination of items very frequently occurring in pairs like *knife and fork* or *mother and father*, as opposed to cases of occasional coordination (Spencer and Luís 2012: 200). Whether this is also true for Ayeri as of now would require a separate survey.<sup>9</sup> Ayeri is not (intended to be) of Eurasian stock, though since there is evidence for this phenomenon, it should at least be considered.

Given the evidence from Turkish, the categorization of deictic prefixes as *either* affixes or clitics is unclear, especially since the diagnostic of scope is devalued by the Turkish examples. On the other hand, suffixes on nouns do not behave this way in Ayeri, as demonstrated in (45)—they rather behave like typical affixes in that they

<sup>9</sup> Or rather, devising supplemental rules.

mandatorily occur on each conjunct. The question is, thus, whether an exception should be made for prefixes on nouns. We may as well assume that they are clitics.

- (45) a. *sobayajang*    *nay* *lajäyjang*  
           *sobaya-ye-ang* *nay* *lajäy-ye-ang*  
           teacher-PL-A    and    student-PL-A  
           ‘(the) teachers and (the) students’
- b. \**sobayaye*    *nay* *lajäyjang*  
           *sobaya-ye*    *nay* *lajäy-ye-ang*  
           teacher-PL    and    student-PL-A
- c. \**sobaya*    *nay* *lajäyjang*  
           *sobaya*    *nay* *lajäy-ye-ang*  
           teacher    and    student-PL-A

From a functional point of view, the exact nature of the deictic prefixes should not matter either way—ParGram (2009–2016: Feature Table) also cites a [DEIXIS] feature with PROXIMAL and DISTAL as its values, which fits *eda-* ‘this’ and *ada-* ‘that’ just fine. At present it is unclear, however, how to represent ‘such (a)’ in this respect, since it is clearly deictic, but neither proximal nor distal. In this case, it should be possible to use [DEIX this/that/such] as well, hence:

- (46) a. *edäyon*  
           *eda=ayon*  
           this=man  
           ‘this man’
- b.  $\begin{bmatrix} \text{PRED} & \text{‘man’} \\ \text{DEIX} & \text{this} \end{bmatrix}$

As described above, proper nouns are case marked by clitic case markers preceding the noun. In fact, these markers must be located somewhere at the left periphery of the NP, so the deictic prefixes stand in between the case marker and the proper noun itself, which is unproblematic for lexical integrity, since the deictic prefixes are not free morphemes. And even if they were part of inflection, the case markers, as clitics, would be on the outside—the order DEICTIC PREFIX – CASE MARKER – NOUN is ungrammatical. An example of this is given in (47).

- (47) a. *Ang* *koronay*            *sa* *eda-Kagan*.  
           *ang* *koron=ay.Ø*    *sa* *eda=Kagan*  
           AT    know=1SG.TOP    P    this=Kagan  
           ‘I know this Kagan.’
- b. \**Ang* *koronay*            *eda-Kaganas*.  
           *ang* *koron=ay.Ø*    *eda=Kagan-as*  
           AT    know=1SG.TOP    this=Kagan-P

- c. \**Ang koronay eda-sa Kagan.*  
 ang koron=ay.Ø eda=sa Kagan  
 AT know=ISG.TOP this=P Kagan

The question now is, what happens to coordinated proper nouns? Since the suffixed case markers on common nouns have the distributional properties of affixes, they occur on every conjunct, the deictic prefixes, however, only occur on the first unless an individuating reading is intended, as shown in (41). For proper nouns it ought to be possible for both a case marker and a deictic prefix to have scope over coordinated proper nouns, as in (48a). Yet, however, this seems slightly odd-sounding, so the strategy in (48b) is preferable, which avoids the problem altogether by making the names an adjunct to the demonstrative  $\text{da-}$  *edanya* ‘this/these one(s)’.<sup>10</sup> The example in (48c) is unproblematic and here as well indicates that the two persons are referred to individually and not as a group.

- (48) a. *Ang koronay sa eda-Kagan nay Ijān.*  
 ang koron=ay.Ø sa eda=Kagan nay Ijān  
 AT know=ISG.TOP P this=Kagan and Ijān  
 ‘I know these Kagan and Ijān.’
- b. *Ang koronay edanyās, Kagan nay Ijān.*  
 ang koron=ay.Ø edanya-as Kagan nay Ijān  
 AT know=ISG.TOP this.one-P Kagan and Ijān  
 ‘I know these, Kagan and Ijān.’
- c. *Ang koronay sa eda-Kagan nay eda-Ijān.*  
 ang koron=ay.Ø sa eda=Kagan nay eda=Ijān  
 AT know=ISG.TOP P this=Kagan and this=Ijān  
 ‘I know this Kagan and this Ijān.’

Of the deictic prefixes,  $\text{da-}$  is not only available to verbs and nouns, but also to adjectives. Like with verbs, it is short for  $\text{da-}$  *danya* ‘such one’ in this case, as demonstrated in (49a). The resulting meaning is ‘the ADJECTIVE one’;  $\text{da-}$  essentially acts as a nominalizer, at least to the extent that the compound of  $\text{da-}$  and an adjective inherits the distributional properties of  $\text{da-}$  *danya* as a demonstrative pronoun. Thus, it can be case- and topic- marked, as shown by (49bc). It can also be modified by another adjective, as in (49c). On the other hand, it cannot be reduplicated for diminution, and can also not be pluralized. Since adjectives follow their heads, the original order of DEMONSTRATIVE – ADJECTIVE remains intact.  $\text{da-}$

<sup>10</sup> Honestly, it is these cases where you wish it were possible to just ask a speaker of your language for their judgement instead of relying on your own intuition—which will most certainly be tainted by interference from your native language—in order not to carry over all too familiar patterns into your creation.

*da-* is thus similar in distribution to English simple clitics such as *'ll*, which occurs in the same place as its full form, the future tense auxiliary *will*.

- (49) a. *Le noyang danyaley tuvo.*  
 le no=yang danya-Ø tuvo  
 PT.INAN want=ISG.A such.one-TOP red  
 'The red one I want.'
- b. *Ang noay da-tuvoley.*  
 ang no=ay.Ø da-tuvo-ley  
 AT want=ISG.TOP one-red-P.INAN  
 'I want the red one.'
- c. *Le noyang da-tuvo kivo.*  
 le no=yang da-tuvo-Ø kivo  
 PT.INAN want=ISG.A one=red-TOP small  
 'The little red one I want.'

The prefix, again, coheres tightly in that no additional material can be inserted. Like with nouns above, inflecting each form in a group of coordinated adjectives results in an individuating reading in (50a). It should be possible for the prefix to take wide scope as in (50b), though it seems better to me to instead rephrase the coordinated adjective as a relative clause like in (49c), for instance, besides using the full form  $\text{ᄃᆞᆫ}$  *danya* + adjectives. Since case is obligatorily marked on every conjunct, (50d) is not grammatical.

- (50) a. *Ang noay da-tuvoley nay da-lenoley.*

 AT want=ISG.TOP one=red and blue-P.INAN

Possessive pronouns like  $\text{ᳵ} \text{ nā}$  ‘my’,  $\text{ᳵ} \text{ vana}$  ‘your’, etc. behave the same way when derived from their usual role as modifiers to free-standing anaphoras ( $\text{ᳵ} \text{ da-nā}$  ‘mine’,  $\text{ᳵ} \text{ da-vana}$  ‘yours’, etc.), except they cannot themselves be modified by adjectives in the way  $\text{ᳵ} \text{ da-tuvo}$  ‘the red one’ is in (49c). Taking all of the examples above into account,  $\text{ᳵ} \text{ da-}$  with adjectives and possessive pronouns seems to be most like a simple clitic according to Zwicky (1977)’s definition, compared to the other contexts it can appear in:

Cases where a free morpheme, when unaccented, may be phonologically subordinated to a neighboring word. Cliticization of this sort is usually associated with stylistic conditions, as in the casual speech cliticization of object pronouns in English; there are both formal *full* pronouns and casual *reduced* pronouns. (5)

Typical of a simple clitic as well, the distribution of  $\text{ᳵ} \text{ da-}$  is restricted by grammatical context, as pointed out regarding example (48b). Unlike in English, which Zwicky (1977) gives examples of, the condition in Ayeri is likely not merely phonological in this case. The nature of the condition, however, is not predetermined in Spencer and Luís (2012), when they elaborate on Zwicky (1977)’s definition that

we may therefore need to define simple clitics along the lines of Halpern (1998), namely, as clitics that may be positioned in a subset of the positions within which the full forms are found, rather than as clitics that have the same distribution as their full-form counterparts as in Zwicky (1977). Under this broader definition, we capture the fact that simple clitics differ from special clitics in that they can appear in some of the positions that are occupied by their corresponding full forms, while special clitics never can. (Spencer and Luís 2012: 44)

Besides deictic prefixes, nouns may also receive a prefix expressing likeness,  $\text{ᳵ} \text{ ku-}$ . This prefix is also applicable to adjectives, and is maybe more adverbial in terms of semantics than purely functional morphemes like  $\text{ᳵ} \text{ da-}$ . In contrast to  $\text{ᳵ} \text{ da-}$ ,  $\text{ᳵ} \text{ ku-}$  has no full-form equivalent. Some examples of it leaning on nouns are given in (51). Like the deictic prefixes,  $\text{ᳵ} \text{ ku-}$  appears in a position which is restricted to functional morphemes. Any other modifiers which appear as free words or phrases (adjectives, relative clauses, nominal adjuncts) follow nouns and cannot appear in the position of  $\text{ᳵ} \text{ ku-}$ . Slightly untypical of a clitic, again, it is not fully ‘promiscuous’ regarding its phonological host in that it requires a nominal, adjectival or phrasal host.

- (51) a. *Ang misya Amān ku-depangas.*

 ang mis-ya Ø Amān ada=ku=depang-as  
 AT act-3SG.M TOP Amān that=like=fool-P

Generally, ꠘꠞ ꠘꠞ- fulfills the function of the preposition *like* in English in (51). However, if it were a preposition in Ayeri, it should trigger the locative on its dependent. In the examples above, however, the NP ꠘꠞ ꠘꠞ- modifies takes the patient case, like predicative NPs are otherwise wont to do. Moreover, while prepositions like ꠘꠞ ꠘꠞ ꠘꠞ ꠘꠞ *kong* ‘inside’ in (52) are free morphemes in Ayeri, ꠘꠞ ꠘꠞ ꠘꠞ ꠘꠞ *ku-* is bound, which becomes apparent by introducing a parenthetical remark in (53).

- (52) a. *Ang yomāy, surpareng, kong sayanya.*  
 ang yoma=ay.Ø surpa=reng kong sayan-ya  
 AT be=1SG.TOP seem=3SG.INAN.A inside cave-LOC  
 ‘I am, it seems, inside a cave.’
- b. *Ang yomāy kong, suprareng, sayanya.*
- (53) a. *Ang misya Amān, surpareng, ku-depangas.*  
 ang mis-ya Ø Amān surpa=reng ku=depang-as  
 AT acts=3SG.M TOP Amān seem=3SG.INAN.A like=fool-P  
 ‘Amān acts, it seems, like a fool.’
- b. \**Ang misya Amān ku, surpareng, depangas.*

Examples (51ab) show that similar to the deictic prefixes, ꠘꠞ ꠘꠞ- precedes its target of modification and can have wide scope over coordinated NPs. As (51c) shows, narrow scope is possible as well, and in this case, again, each conjunct is to be interpreted separately instead of ꠘꠞ ꠘꠞ- modifying both conjuncts collectively. As illustrated in (51d), ꠘꠞ ꠘꠞ- even precedes ꠘꠞ ꠘꠞ ꠘꠞ ꠘꠞ *ada-* as a deictic prefix, for instance, if they appear together. Reversing the order of the prefixes is not possible, as is

shown in (51f). As (51e) shows,  $\frac{3}{2}$ : *ku-* may also have scope over two individuated noun phrase conjuncts. Besides nouns,  $\frac{3}{2}$ : *ku-* is also applicable to pronouns, which makes (54) possible, for example.

- (54) a. *Ang silvye Pada ku=yes.*  
 ang silv-ye Ø Pada ku=yes  
 AT look-3SG.F TOP Pada like=3SG.F.P  
 ‘Pada looks like her.’
- b. *Sa silvye ang Pada ku=ye.*  
 sa silv-ye ang Pada ku=ye  
 PT look-3SG.F A Pada like=3SG.F.TOP  
 ‘Like *her* Pada looks.’

With proper nouns, the same distributional properties as with generic nouns apply, except that  $\frac{3}{2}$ : *ku-* appears, rather idiosyncratically, as a suffix at the right edge of an NP—or at the right edge of the first NP conjunct—if the NP is preceded by a case marker, as shown in (55).

- (55) a. *Ang lentava sa Tagāti diyan-ku.*  
 ang lenta=va.Ø sa Tagāti diyan=ku  
 AT sound=2.TOP P Tagāti worthy=like  
 ‘You sound like Mr. Tagāti.’
- b. *Ang lentava sa Tagāti diyan-ku nay diranas yana.*  
 ang lenta=va.Ø sa Tagāti diyan=ku nay diran-as yana  
 AT sound=2.TOP P Tagāti worthy=like and uncle-P 3SG.M.GEN  
 ‘You sound like Mr. Tagāti and his uncle.’
- c. *Sa lentavāng ku-Tagāti diyan.*  
 sa lenta=vāng ku=Tagāti diyan  
 PT sound=2.A like=Tagāti worthy  
 ‘Like Mr. Tagāti you sound.’

With adjectives, however, there are no idiosyncrasies to this degree.  $\frac{3}{2}$ : *ku-* appears only as a prefix here, as with generic nouns:

- (56) a. *Surpya ku-suta ang Maran.*  
 surp-ya ku=suta ang Maran  
 seem-3SG.M like=busy A Maran  
 ‘Maran seems like he’s busy.’
- b. *Surpya ku-suta nay baras ang Maran.*  
 surp-ya ku=suta nay baras ang Maran  
 seem-3SG.M like=busy and gruff A Maran  
 ‘Maran seems like he’s busy and gruff.’

As (56b) shows, ꠘꠗ ꠘꠗ- again can have wide scope over conjuncts. What further distinguishes ꠘꠗ ꠘꠗ- from a prefix here is that it does not undergo crasis if the adjective begins with an /u/, hence ꠘꠗꠘꠗ ꠘꠗ-ubo /ku'ubo/ ‘like bitter’, not \*ꠘꠗꠘꠗ \*kūbo /'ku:bo/. Again, the position ꠘꠗ ꠘꠗ- appears in is special in that whatever modifies adjectives usually trails after them.

Besides attaching to words, ꠘꠗ ꠘꠗ- is furthermore able to subordinate infinite CPs. Since ꠘꠗ ꠘꠗ- leans on a whole phrase in (56), which affixes (at least in Ayeri) otherwise cannot do, its status as a clitic should be unmistakable in this context.

- (57) *Silvyeng      ku-tabayam      misungas.*  
 silv=yeng      ku=taha-yam      misung-as  
 look=3SG.F.A      like=have-PTCP      secret-P  
 ‘She looks as though having a secret.’

### Suffixes

Besides a number of prefixes and particles occurring before lexical heads which are likely clitics, Ayeri also has a number of morphemes trailing lexical heads as suffixes which do not seem quite like typical inflection. These are, for one, a part of the person suffixes on the verb. Especially tricky in this regard is maybe that “a pronominal affix or incorporated pronominal is effectively a clitic masquerading as an affix. Therefore, if there are pronominal affixes then they should behave exactly like clitics with respect to crucial aspects of morphosyntax” (Spencer and Luís 2012: 144; also compare Corbett 2006: 101). Spencer and Luís (2012) then proceed to give examples from Breton and Irish where the person marking on the verb is in complementary distribution with full NPs:

- (58) Breton (Spencer and Luís 2012: 145; from Borsley et al. 2007):
- a. *Bremañ e lennont al levrioù*  
 now PRT read.PRS.3PL the books  
 ‘Now they are reading the books’
  - b. *Bremañ e lenn ar vugale al levrioù*  
 now PRT read.PRS.3SG the children the books  
 ‘Now the children are reading the books’
  - c. \**Bremañ e lennont ar vugale al levrioù*  
 now PRT read.PRS.3PL the children the books

(59) Irish (Spencer and Luís 2012: 145; from McCloskey and Hale 1984):

- a. *Chuirfinn (\*mé) isteach ar an phost sin*  
 put.COND.ISG (I) in on the job that  
 ‘I would apply for that job’
- b. *Chuirfeadh sibh isteach ar an phost sin*  
 put.COND.3SG you in on the job that  
 ‘You would apply for that job’
- c. *Chuirfeadh Eoghan isteach ar an phost sin*  
 put.COND.3SG Owen in on the job that  
 ‘Owen would apply for that job’

What we can see in (58) is that, according to Spencer and Luís (2012), the verb shows no number marking, defaulting to the singular form, in non-negative clauses if the subject of the verb is overt as either a full noun or a pronoun: plural marking on the verb and a full subject cannot coincide in this case, which is why (58c) is marked ungrammatical. In (59a) we can see that there is no need for an explicit first-person pronoun, since that function is already expressed by person marking on the verb—person inflection on the verb seems to be in complementary distribution with full subject pronouns at least for some parts of the paradigm. In (59b) we have an overt second-person subject pronoun, but in this case, the verb does not agree with it and instead defaults to the third-person form, a clear case of which is given in (59c).

While in Ayeri, there is no defaulting to a certain person in the presence of an overt subject NP as such, there is still the effect of complementary distribution between a pronominal suffix in the absence of an overt subject NP, and a functionally impoverished as well as phonologically reduced form in its presence:

- (60) a. *Suta ang Niyas.*  
 suta ang Niyas  
 busy A Niyas  
 ‘Niyas is busy.’
- b. *Yāng suta.*  
 yāng suta  
 3SG.M.A busy  
 ‘He is busy.’
- (61) a. *Lampya ang Niyas.*  
 lamp-ya ang Niyas  
 walk-3SG.M A Niyas  
 ‘Niyas walks.’

<sup>11</sup> Normally, due to the lexical integrity principle,  $\text{ṛṇṇṇ}$  *lampyāṅ* should be listed as one, but Ayeri's very regular agglutinating nature makes splitting composed words very convenient for illustration as in this case.

Example (64) is an attempt to conceptualize formally that functionally, the inflection takes the role of the subject relation. Thus, (62a) is ungrammatical in that the pronominal suffix  $\text{yāng}$  on the verb is redundant in the presence of a full NP which expresses the same features except that the subject NP's [PRED] value is  $\text{Niyas}$ , not 'pro'. In effect, what is attempted in (62), is to fill a grammatical relation with essentially the same content in two places, which is redundant. Assuming a 'pro' value for the [PRED] feature of  $\text{yāng}$  'he' is LFG's way to model the fact that this pronominal suffix functions as a pro-form available for predication, like a pronoun. Pronouns and full NPs necessarily exclude each other, however.

Example (65) shows, then, the annotations for  $\text{lampya}$  'walks' as agreeing with an overt NP. Here, the suffix does not have a [PRED] feature—it is not available for predication, so that a full NP is allowed as a controller of agreement in the clause, with the person suffix is its person-inflection agreement target. The agreement suffix  $\text{-ya}$  thus reflects that the subject NP needs to have a certain set of person features. The NP which controls verb agreement (in canonical cases the agent NP) needs to match these features in order to establish an agreement relationship. By constraining ( $=_c$ ) the subject's predicator to not be a pro-form in (65) it should also be possible to rule out cases like in (62b), where person agreement is triggered by a pronominal NP, which is ungrammatical, since Ayeri basically supplants person agreement with a pronominal suffix in those cases, as we have seen. If  $\text{yāng}$  were a simple inflectional affix, one of the two examples in (62) should be grammatical.

(65)	$\text{-ya}_I$	$V_{\text{infl}}$	(↑ SUBJ PRED)	$=_c$	$\neg$ 'pro'
			(↑ SUBJ PERS)	=	3
			(↑ SUBJ NUM)	=	SG
			(↑ SUBJ GEND)	=	M
			(↑ SUBJ ANIM)	=	+

The behavior of the pronominal person marking on the verb is thus rather complex, and decidedly unlike inflection in that what looks like an affix on the verb is also an argument of it, like a pronoun, as displayed in (63). Another layer of complexity is added by the fact that such an incorporated pronoun is also eligible for topicalization. As we have seen above, topic marking on nouns is realized by suppressing the realization of the overt case marker, whether it is a proclitic or a suffix. The topic- marked forms of pronouns are also underspecified for case, and they happen to be the same as those of the person-agreement suffixes, as exemplified by  $\text{-ya}$  in (61a). Thus, a topic-marked pronominal suffix on the verb will look exactly like ordinary agreement with a full NP, except that there is no full NP to agree with—hence the subscript numbers in (65) and (66) to distinguish between both kinds of  $\text{-ya}$ .<sup>12</sup>

<sup>12</sup> Assuming that the person suffix on the verb always co-indexes the topic and that one there-

(66)	ṣṣ -ya <sub>2</sub>	V <sub>infl</sub>	(↑ SUBJ PRED)	=	'pro'
			(↑ SUBJ PERS)	=	3
			(↑ SUBJ NUM)	=	SG
			(↑ SUBJ GEND)	=	M
			(↑ SUBJ ANIM)	=	+
			(↑ SUBJ CASE)	=	∅ $\implies$ (↑ TOP) = ↓

Comparing the feature list in (66) with that in (63) and (65), we see that (66) is basically the same as (63), except that either the [CASE] feature is absent, or that the suffix is underspecified for case. In absence of an NP to agree with, it follows from this definitional lack that the person marking on the verb itself is to be identified as constituting the topic, and the correspondent of the preverbal topic marker. In the following case, the preverbal topic marker defines that the topic is an animate agent; this information is united with the functional annotations in (66).

(67)	ṣṣ ang	Cl	(↑ TOP CASE)	=	A
			(↑ TOP ANIM)	=	+

Instances of other case-unmarked nouns can be ruled out as being also part of the topic relation on the grounds of cohesion and functional uniqueness: if the topic is defined as an agent and it cannot be assumed from context that the case-unmarked noun in question is also part of the agent NP, discard it as a candidate. Besides, every core  $\theta$ -role (agent, patient, recipient) can only be assigned once, so if the role specified by the topic marker is already assigned, another NP in the same clause cannot also be assigned the same role. This gets more difficult with non-core roles, though it may be assumed that oblique arguments are less likely to be topicalized.

Possibly confusing with regards to the status of the pronominal suffixes as clitics is that “a pronominal affix or incorporated pronominal is effectively a clitic masquerading as an affix” (Spencer and Luís 2012: 144). While the pronominal suffixes in Ayeri behave in a special way regarding syntax, they lack wide scope, which is typical of affixes (apart from the examples from Turkish in (44)). Unlike Breton (58) or Irish (59), Ayeri’s pronominal affixes do not default to some form, and verbs cannot be unmarked either, that is, verbs always have to be inflected in some way, mostly for phonotactic reasons. Thus, in coordination, every conjunct has to be inflected for person features:

fore does not need to distinguish a person-agreement suffix from a homophonous topicalized pronominal suffix is a premature conclusion. In fact, the agreement suffix always agrees with the subject of the verb, which is most often the agent NP but may, in absence of an agent NP, also be the patient NP. The topic may consist of any NP, also oblique ones. The verb generally does not agree with non-agent or non-patient NPs, however.

- (68) a. *Nedrayāng nay layayāng.*  
 nedra=yāng nay laya-yāng  
 sit=3SG.M.A and read=3SG.M.A  
 ‘He is sits and reads.’
- b. \**Nedrayāng nay laya.*  
 nedra=yāng nay laya  
 sit=3SG.M.A and read
- c. \**Nedra nay layayāng.*  
 nedra nay laya=yāng  
 sit and read=3SG.M.A

In the case of 𐌵𐌳𐌹: *nedra*- ‘sit’ and 𐌵𐌳𐌹: *laya* ‘read’ in (68), leaving off the person marking would theoretically generate valid words, since \*𐌵𐌳𐌹: \**nedra* and \*𐌵𐌳𐌹: \**laya* satisfy phonotactic constraints (see section 1.2). However, Ayeri also has a great number of verb stems which end in a consonant cluster, such as 𐌵𐌳𐌹: *anl*- ‘bring’ or 𐌵𐌳𐌹: *tapy*- ‘set’, which do not form valid words as bare stems since words cannot end in CC. What would be possible instead is that one conjunct might carry the full pronominal suffix as a ‘strong’ form and the other one might only partially co-index the required features by using the less specific corresponding agreement marker as a ‘weak’ form. Differential marking of this kind, though, is simply not established.

After briefly delving into the realm of syntax, let us return to morphology for the second group of suffixes which need clarification. While Ayeri has quantifiers which are independent words, there are also a number of very common ‘little’ quantifiers and degree adverbs which are customarily spelled as suffixes, for instance, 𐌵𐌳𐌹: *-ikan* ‘much, many; very’, 𐌵𐌳𐌹: *kay* ‘few; a little’, 𐌵𐌳𐌹: *nama* ‘just, only’, and 𐌵𐌳𐌹: *-nyama* ‘even’. All of these are adverbial in meaning and while they are comparatively light in their semantics compared to regular content words, they do not particularly resemble functional morphemes either. A natural language which also contains suffixed quantifiers is West Greenlandic (Bittner 1995). According to Bittner (1995)’s terminology, 𐌵𐌳𐌹: *-ikan* in Ayeri as modifying a noun would be a D-quantifier, since it forms “a constituent [with] a projection of N” (59). This is in contrast to A-quantifiers, which are defined as forming “a constituent with some projection of V” (59). That is, A-quantifiers are adverbs like *almost* (𐌵𐌳𐌹: *-ngas* in Ayeri), *mostly*, or *never*, which modify verbs, while D-quantifiers are words like *most*, *some*, or *every*, which modify nouns. Ayeri makes no distinction between A- and D-quantifiers with regards to their being treated as suffixes, however, so that one may find suffixed quantifiers in both groups, sometimes even to the extent that the same quantifier may modify both nouns or verbs. Example (69) gives two instances of suffixed quantifiers from West Greenlandic for comparison with Ayeri in (70).

(69) West Greenlandic (Bittner 1995: 60, 63):

- a. *qaatuur-tuaanna-ngajap-p-a-a*  
break-always-almost-IND-TR-3SG<sub>1</sub>.3SG<sub>2</sub>  
‘he almost always breaks it’
- b. *qaqutigu-rujussuaq*  
rarely-very  
‘very rarely’

- (70) a. *ang adruya                      tadayen-ngas      adaley*  
ang adru=ya.Ø              tadayen=ngas      ada-ley  
AT   break=3SG.M.TOP   always=almost   that-P.INAN  
‘he almost always breaks it’
- b. *kora-ikan*  
kora=ikan  
rarely=very  
‘very rarely’

As we can see in (69a), West Greenlandic incorporates the quantifier suffixes into the verb, while Ayeri—not a polysynthetic language—proceeds more freely in (70a) in that *tadayen* ‘always, every time’ is an adverb and as such a free morpheme which is, however, in turn modified by a suffixed quantifier. Since orthography may be treacherous, let us first try to establish whether *-ngas* ‘almost’ and *-ikan* ‘many, much, very’ and their like are free morphemes or not. As discussed initially regarding the preverbal particles, it is possible to reorder free morphemes, while clitics—as bound morphemes—cannot move around. Adverbs and adjectives are, if they optionally add additional information to a lexical head, adjuncts, and according to Carnie (2013) it is possible for adjuncts to switch places within the same syntactic domain. Adjuncts can also be coordinated with other adjuncts in the same syntactic domain. Furthermore, it is possible to replace X’ nodes with pro-forms, like *one* in English.

- (71) a. *kipisānye-ikan              bino              kāryo*  
kipisān-ye=ikan              bino              kāryo  
painting-PL=many   colorful   big  
‘many big colorful paintings’
- b. *kipisānye-ikan kāryo bino*  
‘many colorful big paintings’
- c. <sup>1</sup>*kipisānye bino-ikan kāryo*  
‘very colorful big paintings’
- d. <sup>1</sup>*kipisānye bino kāryo-ikan*  
‘very big colorful paintings’

- (72) a. *kipisānye-ikan bino nay kāryo*  
           *kipisān-ye=ikan bino nay kāryo*  
           painting-PL=many colorful and big  
           ‘many big and colorful paintings’
- b. \**kipisānye-ikan nay bino kāryo*  
           ‘many and colorful big paintings’
- c. <sup>1</sup>*kipisānye bino-ikan nay kāryo*  
           ‘big and very colorful paintings’

As (71cd) shows, moving *ṣṣṣ* -*ikan* ‘many, much, very’ into different positions results not necessarily in ungrammatical expressions, but in ones with meanings different from what was intended, since *ṣṣṣ* -*ikan*’s scope changes from the noun to the adjective it is appended to. On the other hand, comparing (71a) and (b), it is possible for *ṣṣṣ* *kāryo* ‘big’ and *ṣṣṣ* *bino* ‘colorful’ to switch places with no ill effects. Example (72b) demonstrates that placing a coordinating conjunction between *ṣṣṣ* -*ikan* and *ṣṣṣ* *bino* does not work. The coordination in (72c), on the other hand, is not a problem—not because it is possible to coordinate *ṣṣṣ* -*ikan* and *ṣṣṣ* *kāryo*, but because *ṣṣṣ* *bino-ikan* ‘very colorful’ is considered one syntactic unit which is coordinated with *ṣṣṣ* *kāryo*. Thus, in (71b), we have actually been trying to coordinate *ṣṣṣ* *kipisānye-ikan* ‘many paintings’ with *ṣṣṣ* *bino* ‘colorful’, which does not work, since it is not possible to coordinate a lexical head with an adjunct supposed to modify it, because they are of different syntactic categories. In this regard it is worth mentioning that Ayeri’s quantifier suffixes are rather not complements either, since they are not required to satisfy their head’s argument structure.

One might argue that in (71) and (72) we tried to compare apples to oranges in that *ṣṣṣ* -*ikan* ‘many, much, very’ and *ṣṣṣ* *bino* ‘colorful’ are of different categories, since they do not appear to operate on the same levels. So instead, let us look at possibilities of word order change and coordination between different quantifiers to ensure that we actually stay on the same level. With this there is the problem, however, that it seems strange to modify the same lexical head with multiple different quantifiers, so this test does not really seem feasible to produce grammatical results. Also, with regards to coordination of quantifiers, it is maybe more natural to oppose them with *ṣṣṣ* *soyang* ‘or’ than to coordinate them; the grammatical structure of two categorially identical elements connected by a grammatical conjunction (even if the meaning is disjunctive) remains the same in either case.

- (73) a. \**keynam-ikan-kay*  
           *keynam=ikan-kay*  
           people=many-few  
           ‘few many people’

- b. <sup>?</sup>*keynam-ikan soyang kay*  
 keynam=ikan soyang kay  
 people=many or few  
 ‘few or many people’

In example (73a) we see that it is indeed not possible to combine multiple quantifiers to jointly modify a head in the way it is possible for multiple adjectives to modify the same head as in (71a), for instance. The example of quantifier disjunction in (73b) is also odd unless we permit a reading where *keynam* ‘people’ has been suppressed in the second disjunct to avoid repetition, although in the corresponding case of (74b) below, *da-kay* ‘few ones’ would be preferable.

- (74) a. <sup>?</sup>*keynam[-ikan soyang -kay]*  
 ‘[few or many] people’  
 b. [*keynam<sub>i</sub>-ikan*] *soyang* [<sub>i</sub>-*kay*]  
 ‘[few <sub>i</sub>] or [many people<sub>i</sub>]’

Both tests, moving *keynam-ikan* ‘many, much, very’ into other positions and coordination, have failed so far, and we have evidence that *keynam-ikan* forms a syntactic unit with its head, which points to it being a bound morpheme similar to an affix in spite of its adverb-like meaning. As with free words, it is also possible to replace a quantifier’s head with a pro-form, as mentioned above in the comment on (74b), and shown in more detail in (75). With quantifier suffixes there seems to be an overlap between word-like and affix-like properties, which is typical of clitics.

- (75) a. *Ang vacyan keynam-ikan seygoley.*  
 ang vac-yan keynam-Ø=ikan seygo-ley.  
 AT like-3PL.M people-TOP=many apple-P.INAN  
 ‘Many people like apples.’  
 b. *Ang vacyan danya-ikan seygoley.*  
 ang vac-yan danya-Ø=ikan seygo-ley.  
 AT like-3PL.M such.one-TOP=many apple-P.INAN  
 ‘Many of them like apples.’  
 c. *Ang vacyan da-ikan seygoley.*  
 ang vac-yan da=ikan-Ø seygo-ley.  
 AT like-3PL.M one=many-TOP apple-P.INAN  
 ‘Many (of them) like apples.’

Somewhat untypical of affixes, it seems to be possible to modify suffixed quantifiers with adverbs like *ekeng* ‘too’ and *kagan* ‘far too’, as (76) shows. This suggests that at least in this context, *keynam-ikan* ‘many, much, very’ may actually be

(76) *Ang vacyan keynam-ikan kagan disuley.*  
 ang vac-yan keynam-Ø=ikan kagan disu-ley  
 AT like-3PL.M people-TOP=many far.too disu-P.INAN  
 ‘Far too many people like bananas.’

(77) a. *Ang vacyan, narayang, keynam-ikan kagan disuley.*  
 ang vac-yan nara=yang keynam-Ø=ikan kagan disu-ley  
 AT like-3PL.M say=1SG.A people-TOP=many far.too disu-P.INAN  
 'Far too many people, I say, like bananas.'

b. \**Ang vacyan keynam, narayang, ikan kagan disuley.*

c. \**Ang vacyan keynam-ikan, narayang, kagan disuley.*

d. *Ang vacyan keynam-ikan kagan, narayang, disuley.*

(78) *keynam-ikan patu*  
 keynam=ikan patu  
 people=many surprisingly  
 'surprisingly many people'

The question here as well is whether *ṇṣṣ patu* refers to just ṇṣṣ-*ikan* or to ṇṣṣ-*keynam-ikan*. Replacing ṇṣṣ *keynam* with a pronoun produces a grammatical outcome (79a); doing so with ṇṣṣ-*keynam-ikan*, however, does not (79b). Replacing just ṇṣṣ-*ikan* at good last produces a very questionable expression as well, however (79c).

- (79) a. *keynam-ikan patu*  
 keynam=ikan patu  
 people=many surprisingly  
 ‘surprisingly many people’
- b. \**danyāng patu*  
 danya-ang patu  
 such.one-A surprisingly  
 ‘surprisingly ones’
- c. <sup>??</sup>*keynam da-patu*  
 keynam da=patu  
 people so=surprisingly  
 ‘surprisingly so people’

Another interesting distributional property of suffixed quantifiers in Ayeri is that in spite of their being suffixed, to verbs for instance, they can form arguments of the verb, similar to pronominal suffixes. Thus, with verbs like *ḡḡ kond-* ‘eat’, *ḡḡ -ma* ‘enough’ appears suffixed to the verb instead of as a predicative adverb. Incidentally, the examples in (80) also show that a quantifier attaches after pronominal suffixes, which we have already established as being clitics. An inflectional affix would not normally appear in post-clitic position, which is further evidence to the hypothesis that quantifier suffixes in Ayeri are clitics.

- (80) a. *Kondanang=ma.*  
 kond=nang=ma  
 eat=IPL.A=enough  
 ‘We ate enough.’
- b. *Ang tangay-ikan vana.*  
 ang tang=ay.Ø=ikan vana  
 AT hear=ISG.TOP=much 2.GEN  
 ‘I’ve heard much about you.’

Since Ayeri possesses a zero copula, equative phrases which treat quantifier suffixes as predicative adverbs pose a difficulty in that quantifier suffixes cannot stand alone like predicatives normally would. Thus, in a similar fashion to the behavior of *ḡḡ -ma* ‘enough’ in (80a), the predicative *ḡḡ -ma* in (81b) cliticizes to the only available word: the subject, *ḡḡ adareng* ‘that’.

- (81) a. *Adareng edaya.*  
 ada-reng edaya  
 that-A.INAN here  
 ‘It is here.’

- (83) a. *Ang tahisayan koyās kāryo nay kībasley-ikan.*  
 ang tahisa=yan.Ø koya-as kāryo nay kīhas=ley=ikan  
 AT own=3PL.M.TOP book-P big and map-P.INAN=many  
 ‘They own a big book and many maps.’  
*Not:* ‘They own many big books and maps.’
- b. *Veneyang alingo patu nay para-ven.*  
 vney-ang alingo patu nay para=ven  
 dog-A clever surprisingly and quick=pretty  
 ‘The dog is surprisingly clever and pretty quick.’  
*Not:* ‘The dog is surprisingly pretty clever and quick.’

The interpretations marked as erroneous in (83) can be correctly achieved by ordinarily placing the adjective after the compounds so that the adjective itself has scope over both conjuncts. This is demonstrated in (84) and (85). Again, an unambiguous and individuating interpretation can be achieved by placing the quantifier suffix on each conjunct.

- (84) a. *Ang tabisayan koyajas nay kīhasyeley kāryo.*  
 ang tahisa=yan.Ø koya-ye-as nay kīhas-ye-ley kāryo  
 AT own=3PL.M.TOP book-PL-P and map-PL-P.INAN big  
 ‘They own big books and maps.’

- b. *Ang tabisayan koyās nay kīhasley-ikan kāryo.*  
 ang tahisa=yan.Ø koya-as nay kīhas-ley=ikan kāryo  
 AT own=3PL.M.TOP book-PL-P and map-P.INAN=many big  
 ‘They own many big books and maps.’

- (85) a. *Veneyang alingo nay para patu.*  
 veney-ang alingo nay para patu  
 dog-A clever and quick surprisingly  
 ‘The dog is surprisingly clever and quick.’

- b. *Veneyang alingo nay para-ven patu.*  
 veney-ang alingo nay para=ven patu  
 dog-A clever and quick=pretty surprisingly  
 ‘The dog is surprisingly pretty clever and quick.’

A slight problem is posed by the fact that the comparative suffixes on adjectives, *-eng* (COMP) and *-vā* (SUPL) are obviously derived from their quantifier counterparts meaning ‘rather’ and ‘most’. The question here is, whether they act as clitics as well, or whether grammaticalization has stripped them of some of the clitic-like properties of quantifier suffixes. Consider, for instance example (86):

- (86) a. *Ang koronya Kaman apyanas palay nay ban-eng.*  
 ang koron-ya Kaman apyan-as palay nay ban-eng  
 AT know-3SG.M Kaman joke-P funny and good-COMP  
 ‘Kaman knows a rather funny and good joke.’  
 or: ‘Kaman knows a funnier and better joke.’
- b. *Ang koronya Kaman apyanas palay-eng nay ban-eng.*  
 ang koron-ya Kaman apyan-as palay-eng nay ban-eng  
 AT know-3SG.M Kaman joke-P funny-COMP and good-COMP  
 ‘Kaman knows a funnier and better joke.’  
 or: ‘Kaman knows a rather funny and rather good joke.’

With regards to the dichotomy head-dependent marking, Ayeri is rather thoroughly dependent marking, albeit with the exception of agreement morphology on the verb. Dependent marking is exhibited, for instance, in the expression of possessive relationships, where the dependent is marked for genitive case:

- (88) a. *dema na Tuvo*  
 dema **na** Tuvo  
 aunt GEN Tuvo  
 ‘Tuvo’s aunt’

- b. *kasu bariri nā*  
 kasu bari-ri **nā**  
 basket meat-INS 1SG.GEN  
 ‘my basket of meat’

In (88a), <sup>ᐃᐃ</sup> *Tuvo* is grammatically in possession of her <sup>ᐃᐃ</sup> *dema* ‘aunt’; the possessee forms the head of the phrase while it is modified by the possessor, which receives the marking. In (88b), <sup>ᐃᐃ</sup> *kasu* ‘basket’ forms the head and thus also the possessee while <sup>ᐃᐃ</sup> *nā* ‘my’ serves as the dependent possessor; the genitive case is, then again, marked on the dependent. A further example of dependent marking is the locative case, which is marked on the prepositional object while the preposition itself, as the head of the PP, does not receive marking:

- (89) *agonan minkayya*  
 agonan minkay-**ya**  
 outside village-LOC  
 ‘outside of the village’

The relativizer, likewise, may agree in case with the NP in the matrix clause to which it links the relative clause. This typically happens mainly in formal language and—in terms of linear succession of words at the surface level of the clause—if the relativizer cannot be immediately adjacent to the NP which the relative clause modifies, for example, when an adjective or a possessive pronoun is following the noun:

- (90) *sangalas kivo sas ...*  
 sangal-as kivo s-as ...  
 room-P small REL-P ...  
 ‘the small room which ...’

The only instance of head-marking there is in Ayeri is person-marking on the verb, which manifests when the NP following the verb (agent or patient) is not pronominal and thus there is no pronoun to cliticize to the verb stem, but the verb still receives a suffix that indicates a relation with, usually, the agent NP:

- (91) *Malya ang Amān.*  
 mal-ya ang Amān  
 sing-3SG.M A Amān  
 ‘Amān sings.’

Sentences containing more than one NP also have topic marking on the verb, so that the verb agrees with one of the NPs in topicality. This may be the NP it has person agreement with or any other NP. The topicalized NP as a dependent of the verb is, in turn, zero-marked, so that the marking relationship for topics is bilateral and thus mixed:

- (92) *Sa manya ang Ajān Pila.*  
 Sa man-ya ang Amān Ø Pila  
 PT greet-3SG.M A Ajān TOP Pila  
 ‘Pila, Ajān greets her.’

In this example, the verb exhibits canonic agreement with the agent, *Ajān*, in person, gender, and number. It is additionally marked for a patient topic, *Pila*

*Pila*, and thus serves as an agreement target for two different controller NPs. The agreement relation is of a different kind for each of the two NPs, however.

## 4 Grammatical categories

---

While the previous chapter was about general mechanisms of marking in Ayeri, this chapter will dive into the various parts of speech in order to define their morphology with a closer look. I will begin with nouns as the main carriers of meaning, then deal with other parts of speech that regularly feature in or in combination with the noun phrase—pronouns, adjectives, and adpositions. Following this, there will be a discussion of verbs and adverbs before moving on to numerals and conjunctions.

### 4.1 Nouns

Nouns in Ayeri have *gender* and *number* as their inherent grammatical properties. Besides common nouns, there are, of course, also proper nouns (that is, names) and nominalizations. Nouns, as the heads of NPs, are also assigned *case* by the verb, which is a third grammatical property they display. For an illustration of the declension paradigms, compare Tables 4.1–4.4.

#### 4.1.1 Gender

Grammatical gender in Ayeri consists of two tiers which are subdivided into four classes based on a mixture of semantic and ontological properties:

Table 4.1: Declension paradigm for  $\text{ᠪᠠᠳᠠᠨ}$  *badan* ‘father’ (animate; consonantal root)

	Singular		Plural	
TOP	<i>badan</i>	‘the father’	<i>badanye</i>	‘the fathers’
A	<i>badanang</i>	‘father’	<i>badanjang</i>	‘fathers’
P	<i>badanas</i>	‘father’ (obj.)	<i>badanjas</i>	‘fathers’ (obj.)
DAT	<i>badanyam</i>	‘to the father’	<i>badanjyam</i>	‘to the fathers’
GEN	<i>badanena</i>	‘of the father’	<i>badanyena</i>	‘of the fathers’
LOC	<i>badanya</i>	‘at the father’	<i>badanjya</i>	‘at the fathers’
CAUS	<i>badanisa</i>	‘due to the father’	<i>badanjisa</i>	‘due to the fathers’
INS	<i>badaneri</i>	‘with the father’	<i>badanyeri</i>	‘with the fathers’

Table 4.2: Declension paradigm for  $\text{ᠮᠠᠪᠠ}$  *māva* ‘mother’ (animate; vocalic root)

	Singular		Plural	
TOP	<i>māva</i>	‘the mother’	<i>māvaye</i>	‘the mothers’
A	<i>māvāng</i>	‘mother’	<i>māvajang</i>	‘mothers’
P	<i>māvās</i>	‘mother’ (obj.)	<i>māvajas</i>	‘mothers’ (obj.)
DAT	<i>māvayam</i>	‘to the mother’	<i>māvajyam</i>	‘to the mothers’
GEN	<i>māvana</i>	‘of the mother’	<i>māvayena</i>	‘of the mothers’
LOC	<i>māvaya</i>	‘at the mother’	<i>māvaiya</i>	‘at the mothers’
CAUS	<i>māvaisa</i>	‘due to the mother’	<i>māvajisa</i>	‘due to the mothers’
INS	<i>māvari</i>	‘with the mother’	<i>māvayeri</i>	‘with the mothers’

The animate gender refers, broadly speaking, to entities that are considered alive or are closely associated with living things, such as events, concepts, or activities executed or connected to them. The ‘masculine’ and ‘feminine’ subcategories are applied to humans, animals whose sex is known (for example on behalf of breeding them or keeping them as pets), and gods—basically anything that shows sexual dimorphism or is assumed to be an exponent of it as well as nouns referring to such entities in a functional way, for instance,  $\text{ᠪᠠᠳᠠᠨ}$  *badan* ‘father’ and  $\text{ᠮᠠᠪᠠ}$  *māva* ‘mother’. The remainder falls into the ‘neuter’ category—plants, for instance, body parts, or animals whose sex is unknown. The ‘inanimate’ category typically contains materials and things, such as tools. Furthermore, animals and plants change their category to inanimate as well if they serve as food. There are exceptions to either group, where elements appear in them for no obviously discernable reason. In order to illustrate,

Table 4.3: Declension paradigm for *ᄃᆞᆫᆫᆞᆫ* *kirin* ‘street’ (inanimate; consonantal root)

	Singular		Plural	
TOP	<i>kirin</i>	‘the street’	<i>kirinye</i>	‘the streets’
A	<i>kirinreng</i>	‘street’	<i>kirinyereng</i>	‘streets’
P	<i>kirinley</i>	‘street’ (obj.)	<i>kirinyeley</i>	‘streets’ (obj.)
DAT	<i>kirinyam</i>	‘to the street’	<i>kirinjyam</i>	‘to the streets’
GEN	<i>kirinena</i>	‘of the street’	<i>kirinyena</i>	‘of the streets’
LOC	<i>kirinya</i>	‘at the street’	<i>kirinjya</i>	‘at the streets’
CAUS	<i>kirinisa</i>	‘due to the street’	<i>kirinjisa</i>	‘due to the streets’
INS	<i>kirineri</i>	‘with the street’	<i>kirinyeri</i>	‘with the streets’

Table 4.4: Declension paradigm for *ᄃᆞᆫᆫᆞᆫ* *pera* ‘measure’ (inanimate; vocalic root)

	Singular		Plural	
TOP	<i>pera</i>	‘the measure’	<i>peraye</i>	‘the measures’
A	<i>perareng</i>	‘measure’	<i>perayereng</i>	‘measures’
P	<i>peraley</i>	‘measure’ (obj.)	<i>perayeley</i>	‘measures’ (obj.)
DAT	<i>perayam</i>	‘to the measure’	<i>perajyam</i>	‘to the measures’
GEN	<i>perana</i>	‘of the measure’	<i>perayena</i>	‘of the measures’
LOC	<i>peraya</i>	‘at the measure’	<i>perajya</i>	‘at the measures’
CAUS	<i>peraisa</i>	‘due to the measure’	<i>perajisa</i>	‘due to the measures’
INS	<i>perari</i>	‘with the measure’	<i>perayeri</i>	‘with the measures’

here are a few examples for each category:

- (2) a. Animate masculine:  
*ᄃᆞᆫᆫᆞᆫ* *badan* ‘father’, *ᄃᆞᆫᆫᆞᆫ* *netu* ‘brother’, *ᄃᆞᆫᆫᆞᆫ* *aguyan* ‘rooster’, *ᄃᆞᆫᆫᆞᆫ* *Ajān*, *ᄃᆞᆫᆫᆞᆫ* *Latun*;
- b. Animate feminine:  
*ᄃᆞᆫᆫᆞᆫ* *māva* ‘mother’, *ᄃᆞᆫᆫᆞᆫ* *kina* ‘sister’, *ᄃᆞᆫᆫᆞᆫ* *aguway* ‘hen’, *ᄃᆞᆫᆫᆞᆫ* *Maha*, *ᄃᆞᆫᆫᆞᆫ* *Trānay*;
- c. Animate neuter:  
*ᄃᆞᆫᆫᆞᆫ* *adang* ‘palm tree’, *ᄃᆞᆫᆫᆞᆫ* *binu* ‘color’, *ᄃᆞᆫᆫᆞᆫ* *ikam* ‘deer’, *ᄃᆞᆫᆫᆞᆫ* *kadān* ‘harvest’, *ᄃᆞᆫᆫᆞᆫ* *cān* ‘love’, *ᄃᆞᆫᆫᆞᆫ* *nanga* ‘house’, *ᄃᆞᆫᆫᆞᆫ* *tampu* ‘luck’, *ᄃᆞᆫᆫᆞᆫ* *yila* ‘foot’;
- d. Inanimate:  
*ᄃᆞᆫᆫᆞᆫ* *ahal* ‘sand’, *ᄃᆞᆫᆫᆞᆫ* *bema* ‘egg’, *ᄃᆞᆫᆫᆞᆫ* *kaban* ‘spear’, *ᄃᆞᆫᆫᆞᆫ* *melung* ‘yogurt’, *ᄃᆞᆫᆫᆞᆫ* *nusān* ‘damage’, *ᄃᆞᆫᆫᆞᆫ* *payutān* ‘mathematics’.

Ayeri only distinguishes singular and plural in nouns, which receive plural marking; verbs, then, agree with agent NPs in number in the canonical case. Ordinarily, nouns in Ayeri are countable, however, there is also a group of uncountable nouns as well as a (small) group of nouns which are always plural. As above, I will list a few words from each group for illustration:

## (4) a. Countable nouns:

၁၂၁၂ *ajam* ‘toy’ — ၁၂၁၂၂ *ajamye* ‘toys’,  
 ၂၁၂ *devo* ‘head’ — ၂၁၂၂ *devoye* ‘heads’,  
 ၁၂၁၂ *inun* ‘fish’ — ၁၂၁၂၂ *inunye* ‘fish’ (pl.),  
 ၁၂၁၂ *netu* ‘brother’ — ၁၂၁၂၂ *netuye* ‘brothers’;

## b. Uncountable nouns:

၁၂၁၂ *abal* ‘sand’, ၁၂၁၂ *bakay* ‘stuff’, ၁၂၁၂ *gabān* ‘hope’, ၁၂၁၂ *mingan* ‘ability’;

## c. Plurale tantum nouns:

၁၂၁၂ *burang* ‘lifestock, cattle’,<sup>1</sup> ၁၂၁၂ *ganengan* ‘siblings’, ၁၂၁၂ *keynam* ‘people’, ၁၂၁၂ *tang* ‘ears’.

Most concrete things that exist as discrete entities are countable, also, for instance, animals and livestock—fish, deer, sheep etc. are thus countable, unlike in English; pants, pliers, scissors, glasses, etc. are by default singular as well. Uncountable, on the other hand, are materials in general or abstract concepts. There are also a number of nouns which are plural by default, most notably entities which often occur in groups, but there is as well the odd word for which there seems to be no reason to be included in this group, for instance, ၁၂၁၂ *binō* ‘paint’, and ၁၂၁၂ *gimbay* ‘sorrows’. A few body parts are also plurale tantum nouns, especially those which occur in pairs (၁၂၁၂ *niva* ‘eye’ is a notable exception).

As demonstrated in (4a), the noun plural marker is ၁၂ -*ye*, which in native orthography also occurs in the variant ၁၂ or ၁၂. As described above (section 1.1.1, p. 7), the plural marker may also be reduced to [dʒ] <-j> before case suffixes that begin with /j/ or with a vowel other than /e/, like ၁၂၁၂ -*ang* (A) or ၁၂၁၂ -*yam* (DAT):

(5) a. ၁၂၁၂၁၂ *diranang* (uncle-A) + ၁၂ -*ye* (PL)

→ ၁၂၁၂၁၂ *diranjang* (uncle-PL-A),

b. ၁၂၁၂ *diranena* (uncle-GEN) + ၁၂ -*ye* (PL)

→ ၁၂၁၂၁၂ *diranyena* (uncle-PL-GEN),

c. ၁၂၁၂၁၂ *diranyam* (uncle-DAT) + ၁၂ -*ye* (PL)

→ ၁၂၁၂၁၂ *diranjyam* (uncle-PL-DAT).

For plurale tantum, to express a singular entity, it is always possible to use a genitive phrase like —၁၂၁၂၁၂ ...-*ena men* ‘one of ...’ (...-GEN one), for instance:

<sup>1</sup> Specifically in this meaning; ၁၂၁၂ *burang* can also simply mean ‘animal’, in which case there is a plural form ၁၂၁၂၁၂ *burangye* ‘animals’.

- (6) a. *Nupayon tangang nā.*  
 nupa-yon tang-ang nā  
 hurt-3PL.N ears-A 1SG.GEN  
 ‘My ears hurt.’
- b. *Na nupareng tang nā men.*  
 na nupa=reng tang-Ø nā men  
 GENT hurt=3SG.INAN.A ears-TOP 1SG.GEN one  
 ‘Of my ears, one is hurting.’

Number in nouns can also be manipulated by quantifiers which attach to declined nouns as suffixes—or rather, enclitics. In this case, when plurality is indicated by the quantifier, the noun is not additionally marked for number; the verb, however, keeps agreeing in number:

- (7) a. *Ajayon ganjang kivo.*  
 aja-yon gan-ye-ang kivo  
 play-3SG.N child-PL-A small  
 ‘The small children are playing.’
- b. *Ajayon ganang-ikan kivo.*  
 aja-yon gan-ang=ikan kivo.  
 play-3SG.N child-A=many small  
 ‘Many small children are playing.’

Likewise, when nouns are modified by numerals, plurality is not normally marked again on the noun. In example (8a), we see a plural noun, *ṣṣ nanga* ‘house’, and in (8b) the same phrase is repeated again with plurality implied by the use of a numeral, *ṣṣ sam* ‘two’; the plural noun itself appears unmarked in its singular form in this case.

- (8) a. *Ang no vehya sitang-yām nangajas veno nay biro.*  
 ang no veh=ya.Ø sitang=yām nanga-ye-as veno nay hiro  
 AT want build=3SG.M.TOP self=3SG.M.DAT house-PL-P pretty and new  
 ‘He wants to build himself pretty new houses.’
- b. *Ang no vehya sitang-yām nangās sam veno nay biro.*  
 ang no veh=ya.Ø sitang=yām nanga-as sam veno nay hiro  
 AT want build=3SG.M.TOP self=3SG.M.DAT house-P two pretty and new  
 ‘He wants to build himself two pretty new houses.’

An exception to this is the use of words for the numeral powers, like *ṣṣ lan* ‘dozen’, *ṣṣ menang* ‘gross’, *ṣṣ samang* ‘myriad’, etc. in an unspecified way like ‘dozens of people’. In this case, to convey that the numeral is not to be understood

as a precise value, the modified noun will appear in the plural—even if it is a plurale tantum like ꠘꠘꠘ *keynam* ‘people’:

- (9) *Bengyon keynamjang menang.*  
 beng-yon keynam-ye-ang menang  
 attend-3SG.N people-PL-A gross  
 ‘Hundreds of people attended.’

As we have seen in various examples above, proper nouns in Ayeri do not receive inflection for case by suffixes as common nouns do, and for the purpose of number they are treated as uncountable in Ayeri—they resist inflection by suffixation, marking their special status.<sup>2</sup> However, they can still be modified by quantifiers and quantifying suffixes; verb agreement as well can be used to indicate plurality:

- (10) a. *Sabayan cabo ekeng ang Yan.*  
 saha-yan cabo ekeng ang Yan  
 come-3PL.M late too A Yan  
 ‘The Yans are coming too late.’  
 b. *Ang apateng sa Yan-ikan.*  
 ang apa=teng sa Yan=ikan  
 AT laugh=3PL.F.A P Yan=all  
 ‘They laughed at (all) the Yans.’

#### 4.1.3 Case

As demonstrated in the declension tables at the beginning of this section (Tables 4.1–4.4), Ayeri’s NPs are marked for case, which is governed by the verb. Since in Ayeri, case marking is at least partially based on semantics rather than just purely function or structure which causes a few exceptions, it is better, in my opinion, not to use the classic labels of nominative (S/A) and accusative (O), or of absolutive (S/P) and ergative (O) for the first two core roles. Instead, I will be using the terms ‘agent’ and ‘patient’, which I hope brings about some more clarity, especially when discussing the mentioned exceptions later on. For a discussion of how Ayeri deals with subjecthood, see section 5.4.4.

<sup>2</sup> Many common names in Ayeri are derived from regular words in the language, so the language needs to have a way to distinguish between regular use and use as a name. For instance, the name ꠘꠘ *Yan* also means ‘boy, son’ as a common noun.

## Agent

What I call ‘agent’ here is, to quote Fillmore (2003 [1968]), “the case of the typically animate perceived instigator of the action identified by the verb” (46). Fillmore (2003 [1968]) himself qualifies this definition, however, in that the “escape qualification ‘typically’ expresses my awareness that contexts which I will say require agents are sometimes occupied by ‘inanimate’ nouns like *robot* or ‘human institution’ nouns like *nation*” (46, footnote 31). Payne (1997) summarizes on prototypical agents with regards to their topicality that a “less technical way of expressing this fact is to say that people identify with and like to talk about things that act, move, control events, and have power” (151).

Agents in Ayeri frequently embody the properties quoted by both Fillmore (2003 [1968]) and Payne (1997) in this regard, including Fillmore (2003 [1968])’s caveat. However, importantly, ‘agent’ in Ayeri is a macrorole that may be applied to, for instance, instruments, experiencers, and less typical actors as well, specifically, in absence of more prototypical candidates for agenthood in a sentence. It thus comes very close to a nominative, except that it does not need to be locus of the sentence’s topic—although agents very typically are topics, as Payne (1997: 151) goes on to note. Thus, the first NP after the verb in all of the following examples is treated as an agent; the agent is marked by the suffix *-ang* for animate referents and the suffix *-reng* for inanimate referents; names and verbal topic agreement are marked by the clitic case markers *ang* and *eng*, respectively:

- (11) a. *Ang tinkaya Yan kunangley.*  
 ang tink-a-ya Ø Yan kunang-ley  
 AT open-3SG.M TOP Yan door-P.INAN  
 ‘Yan opens the door.’
- b. *Le tinkaya ayonang kunang.*  
 le tink-a-ya ayon-ang kunang-Ø  
 PT open-3SG.M man-A door-TOP  
 ‘The door is opened by a/the man’,  
 or: ‘The door, a/the man opens it.’
- c. *Eng tinkāra tinkay kunangley.*  
 eng tink-a-ara tinkay-Ø kunang-ley  
 AT.INAN open-3SG.INAN key-TOP door-P.INAN  
 ‘The key opens the door.’
- d. *Tinkāra kunangreng.*  
 tink-a-ara kunang-reng  
 open-3SG.INAN door-A.INAN  
 ‘The door opens.’

- e. *Sā tinkaya ang Yan kunangley yan.*  
 sā tinka-ya ang Yan kunang-ley yan.Ø  
 CAUT open-3SG.M A Yan door-P.INAN 3SG.M.TOP  
 ‘They make Yan open a/the door’,  
 or: ‘Because of them, Yan opens the door.’

In predicative constructions, the constituent which a quality is assigned to or about which a judgement is made is also assigned the agent case:

- (12) a. *Tado tinkayreng.*  
 tado tinkay-reng  
 old key-A.INAN  
 ‘The key is old.’  
 b. *Ang Yan nimpayās ban.*  
 ang Yan nimpaya-as ban  
 A Yan runner-P good  
 ‘Yan is a good runner.’

With regards to constituents’ roles in ditransitive verb frames, donors are represented by agents in Ayeri as well, since they are the origin of whatever is conceptually passed on to the recipient party:

- (13) *Le ilya ang Yan tinkay yam Cānlay.*  
 le il-ya ang Yan tinkay-Ø yam Cānlay  
 PT give-3SG.M A Yan key-TOP DAT Cānlay  
 ‘The key, Yan gives it to Cānlay.’

#### Patient

Patients are less of a definitional problem than agents, since in transitive sentences, they are very typically undergoers, that is, the constituent that is acted on, affected, or produced by the action expressed by the verb. The patient case is thus the one assigned by default to direct objects—but also to predicative nominals. In ditransitive sentences, the theme is represented by the patient. Animate patients are marked by 𐀓𐀮 -as, inanimate ones by 𐀓𐀮 -ley; for names and verbal topic agreement, the markers are 𐀓 sa and 𐀓 le, respectively:

- (14) a. *Ang silvye Briha sa Taryan.*  
 ang silv-ye Ø Briha sa Taryan  
 AT see-3SG.F TOP Briha P Taryan  
 ‘Briha sees Taryan.’

- b. *Sa manye ang Briha Taryan.*  
 sa man-ye ang Briha Ø Taryan  
 PT greet-3SG.F A Briha TOP Taryan

‘Taryan is greeted by Briha’,  
 or: ‘Taryan, Briha greets him.’

- (15) a. *Ang rimaye Briha kunangley.*  
 ang rima-ye Ø Briha kunang-ley  
 AT close-3SG.F TOP Briha door-P.INAN

‘Briha closes a/the door.’

- b. *Le rimaye ang Briha kunang.*  
 le rima-ye ang Briha kunang-Ø  
 PT.INAN close-3SG.F A Briha door-TOP

‘The door is closed by Briha’,  
 or: ‘The door, Briha closes it.’

- (16) *Ang ilya Taryan koyaley yam Kandan.*  
 ang il-ya Ø Taryan koya-ley yam Kandan  
 AT give-3SG.M TOP Taryan book-P.INAN DAT Kandan

‘Taryan gives Kandan a book.’

As the translations of the examples above show, topicalizing the patient can be used to create an effect similar to English’s passive voice, except that the patient will not become marked by the agent case for logical reasons—this is a notable difference from the nominative. Even if the agent NP is omitted, the patient NP will not be changed to the agent case, since that would reverse the direction of action:

- (17) *Manya sa Taryan. ≠ Manya ang Taryan.*  
 man-ya sa Taryan Man-ya ang Taryan  
 greet-3SG.M P Taryan greet-3SG.M A Taryan

‘Taryan is greeted.’ ≠ ‘Taryan greets.’

This example shows that the case of the NP will not change, however, the verb will: it now agrees with the next argument in line, the patient NP. It will not do so, however, if the order of arguments is just scrambled, as exemplified by (18). This is to say that the verb does not simply agree with whichever NP follows it, even if it can be assumed that verb agreement in Ayeri developed along similar lines in-world, which will become especially apparent in the discussion of pronouns.<sup>3</sup>

<sup>3</sup> Mismatches in agreement in connection to scrambling such as exemplified by (18b) are to be expected, however, since the brain can only handle so much information between the controller and the target of an agreement relationship. Corbett (2006), notes that with regards

- (18) a. *Sa manye Taryan ang Briha.*  
 sa man-ye Ø Taryan ang Briha  
 PT greet-3SG.F TOP Taryan A Briha  
↑  
person agreement  
 ‘Taryan is greeted by Briha’,  
 or: ‘Taryan, Briha greets him.’
- b. \**Sa manya Taryan ang Briha.*  
 sa man-ya Ø Taryan ang Briha  
 PT greet-3SG.M TOP Taryan A Briha  
↑  
\*person agreement

Besides being the default case for direct objects, the patient case is also assigned to predicative nominals, by analogy with transitive sentences and in spite of the likening nature of the construction:

- (19) *Ang Yan nimpayās ban.*  
 ang Yan nimpaya-as ban  
 A Yan runner-P good  
 ‘Yan is a good runner.’

#### Dative

The most typical use of the dative is for the recipient NP in a ditransitive clause; as such, it may be a recipient proper or the entity to whose benefit the action is carried out. A number of transitive verbs also use the dative for their object, for example, when it is the target of address. The dative can furthermore be used to mark movement toward a place. The case suffix for datives is ꠘꠗ -*yam* for both animate and inanimate entities. Names and verbal topic agreement are marked equally by ꠘꠗ *yam*. Verbs do not exhibit person agreement with dative NPs, since experiencers are treated as agents.

- (20) a. *Ang ilya Taryan koyaley ayonyam.*  
 ang il-ya Ø Taryan koya-ley ayon-yam  
 AT give-3SG.M TOP Taryan book-P.INAN man-DAT  
 ‘Taryan gives a book to the man.’

to agreement in NP conjuncts, “distant agreement is rare, and that agreement with the nearest noun phrase or agreement with all (resolution) is much more common” (62). If there were an extensive corpus of texts written by Ayeri speakers, it might be interesting to gather statistics on the number of words between target and controller in relation to the prevalence of agreement mismatches.

- b. *Ang ilya                      Taryan koyaley              yam Kandan.*  
 ang il-ya              Ø    Taryan koya-ley              yam Kandan  
 AT   give-3SG.M   TOP   Taryan   book-P.INAN   DAT   Kandan  
 ‘Taryan gives Kandan a book.’
- c. *Yam ilya                      ang Taryan koyaley              ayon.*  
 yam il-ya                      ang Taryan koya-ley              ayon-Ø  
 DATT   give-3SG.M   A   Taryan   book-P.INAN   man-TOP  
 ‘The man is given a book by Taryan’,  
 or: ‘The man, Taryan gives him a book.’

The three examples in (20) show the regular use of the dative as the case the recipient of the theme appears in. What distinguishes Ayeri from a pure split-S language is that all constituents can serve as topics, not just agents and patients with regards to their function as syntactic subjects. Thus, it is also possible for dative NPs to appear as topics—person agreement is unaffected by this, though. The following example shows the addressee of a speech act in the dative case; the message is treated as the theme which is passed on:

- (21) *Ang ningye      māva              ninganas      ganyam      yena.*  
 ang ning-ye      māva-Ø              ningan-as      gan-yam      yena  
 AT   tell-3SG.F   mother-TOP   story-P   child-DAT   3SG.F.GEN  
 ‘The mother tells her child a story.’

As mentioned above, the dative can also take on an allative meaning insofar as it marks the target of a motion, as displayed in (22a). As an extension of this means, the adpositional object may as well appear in the dative, since Ayeri cannot distinguish, for instance, ‘up’ from ‘to the top of’ with just the preposition, in this case *ling* ‘on top of’. With the adpositional object in the locative case (see below), the phrase in (22b) would imply that the man were literally going to the top of the temple, that is, possibly ending up on its roof.

- (22) a. *Ang nimpye      lay              māvayam      yena.*  
 ang nimp-ye      lay-Ø              māva-yam      yena  
 AT   run-3SG.F   girl-TOP   mother-DAT   3SG.F.GEN  
 ‘The girl runs to her mother.’
- b. *Ang saraya      ayon              manga ling      natrangyam.*  
 ang sara-ya      ayon-Ø              manga ling      natrang-yam  
 AT   go-3SG.M   man-TOP   DIR   top   temple-DAT  
 ‘The man goes up to the temple.’

*Genitive*

The genitive is used to mark possessors; attributive genitives follow the possessee. It can also be used for ablative meanings, that is, to mark the place from which a motion originates, in analogy to the dative's allative use. The genitive is marked on common nouns with the suffix : $\mathfrak{z}$  -*na*. If a noun stem ends in a consonant, the marker becomes : $\mathfrak{z}$  -*ena*, compare Tables 4.1–4.4 above. Names and verbal topic agreement are marked by  $\mathfrak{z}$  *na*. There is no animacy distinction in the genitive case.

- (23) a. *Pakur ledanang netuna nā.*  
 pakur ledan-ang netu-na nā  
 sick friend-A brother-GEN 1SG.GEN  
 'My brother's friend is sick.'
- b. *Kopo dilengyereng ajānena.*  
 kopo dileng-ye-reng ajān-ena  
 difficult rule-PL-A.INAN game-GEN  
 'The rules of the game are difficult.'
- c. *Ang nakasyo tamo ibangya na Niyas.*  
 ang nakas-yo tamo-Ø ibang-ya na Niyas  
 AT grow-3SG.N wheat-TOP field-LOC GEN Niyas  
 'There is wheat growing on Niyas's field.'
- d. *Na nakasyo tamoang ibangya Niyas.*  
 na nakas-yo tamo-ang ibang-ya Ø Niyas  
 GENT grow-3SG.N wheat-A field-LOC TOP Niyas  
 'Regarding Niyas, there is wheat growing on his field.'

Futhermore, Ayeri does not make a distinction between alienable and inalienable possession, so that typically inalienable things such as body parts, relatives and family members, or personal items and tools are all treated as described above. Consider the following example for illustration:

- (24) *Ang puntaye māva nā mitrangas yena sembari yena.*  
 ang punta-ye māva-Ø nā mitrang-as yena semba-ri yena  
 AT brush-3SG.F mother-TOP 1SG.GEN hair-P 3SG.F.GEN comb-INS 3SG.F.GEN  
 'My mother is brushing her hair with her comb.'

The above examples show the regular use of the genitive as a marker of possession. The following examples, on the other hand, show the genitive in its ablative function:

- (25) *Ang sabaya Vetayan rimanena.*  
 ang saha-ya Ø Vetayan riman-ena  
 AT come-3SG.M TOP Vetayan city-GEN  
 ‘Vetayan comes from the city.’

### Locative

The locative marks basic locations, often the default that is associated with a verb. It is also the case in which adpositional objects normally appear, besides the special cases using the dative and the genitive mentioned above. Common nouns are marked by  $\text{ya}$   $-ya$ ;<sup>4</sup> names and verbal topic agreement use the marker  $\text{ya}$ . There is no difference made between animate and inanimate referents in the locative.

- (26) a. *Ang nedraya paray binya.*  
 ang nedra-ya paray-Ø hin-ya  
 AT sit-3SG.M cat-TOP box-LOC  
 ‘The cat sits in the box.’  
 b. *Ang naraya Ajān ya Kaman.*  
 ang nara-ya Ø Ajān ya Kaman  
 AT speak-3SG.M TOP Ajān LOC Kaman  
 ‘Ajān speaks to Kaman.’  
 c. *Ya mica ang Kaman Visamhinang.*  
 ya mit-ya ang Kaman Ø Visamhinang  
 LOCT live-3SG.M A Kaman TOP Visamhinang  
 ‘Kaman lives in Visamhinang’,  
 or: ‘Visamhinang is where Kaman lives.’

The example sentences in (26) show locative NPs that are not further specified by adpositions so that the correct interpretation may be dependent on context and the experience of the addressee. Example (26a) is an instance of this circumstance, insofar as experience tells that cats like to sit inside boxes, so further specifying the position with the preposition  $\text{ႬႬႬ}$  *kong* ‘inside’ would be emphasizing that the cat is not sitting just anywhere, but really *inside* the box as opposed to on top of it, for instance. The following example has the cat sitting on top of the box:

- (27) *Ang nedraya paray ling binya.*  
 ang nedra-ya paray-Ø ling hin-ya  
 AT sit-3SG.M cat-TOP on.top box-LOC  
 ‘The cat sits on the box.’

<sup>4</sup> Older texts still exhibit an allomorph  $\text{ႬႬႬ}$   $-ea$ , used especially in combination with the plural suffix  $\text{ႬႬႬ}$   $ye$ , giving  $\text{ႬႬႬ}$   $-yēa$ . The modern language uses  $\text{ႬႬႬ}$   $-fya$ .

Ayeri also has a number of postpositions, which does not change that the adposition object is marked for locative case, however:

- (28) *Ang mican edaya **tenyanya** tan pesan.*  
 ang mit-yan edaya tenyan-ya tan pesan  
 AT live-3PL.M here death-LOC 3PL.M.GEN until  
 ‘They lived here until their death.’

#### Causative

The causative marks the cause or causer of an action, the instigator or the reason on behalf of which an agent is acting. It is thus similar to the agent case, though it does not replace it in Ayeri; verbs do not exhibit person agreement with causers even though their action logically supersedes or precedes that of the agent in the embedded event. Dixon (2000) writes that a “causer refers to someone or something (which can be an event or state) that initiates or controls the activity. This is the defining property of the syntactic–semantic function A (transitive subject)” (30). According to Comrie (1989: 176), the causee—the agent of the event controlled by the causer—normally takes the highest place in the hierarchy of syntactic constituents that is not already filled, in this case, by the causer. This observation, however, is complicated by Ayeri’s more or less semantics-based case marking as well as topicalization. In the following, I will give examples of nominal marking for cause as before; a discussion of the morphosyntax of Ayeri’s morphological causative constructions will be deferred to the section on valency-increasing operations.

Causers or causes are marked by *isa* for common nouns; names and verbal topic agreement use the marker *sā*. As stated above, verbs do not agree with causers even though they have agent-like semantics. There is no animacy distinction in the marking of causers.

- (29) a. *Ang rua sarāyn seyaranisa.*  
 ang rua sara=ayn.Ø seyaran-isa  
 AT must leave=IPL.TOP rain-CAUS  
 ‘We had to leave due to the rain.’  
 b. *Ang yomāy edaya sā Apican.*  
 ang yoma=ay.Ø edaya sā Apican  
 AT be=ISG.TOP here CAUS Apican  
 ‘I am here because of Apican.’

- c. *Sā nimpvāng hakasley yan.*  
*sā nimp=vāng hakas-ley yan.Ø*  
 CAUT run=2SG.A mile-P.INAN 3PL.M.TOP  
 ‘You run a mile because of them’,  
 or: ‘Due to them, you run a mile’,  
 or: ‘They make you run a mile.’

Regarding the typological oddities mentioned above, example (29c) shows what happens in Ayeri with regards to the marking of causers. Essentially, the causer topic was grammaticalized to express a causation relationship.

#### Instrumental

The instrumental marks the means by which an action is carried out by an agent. This can be a tool as well as an animate being by whose help the action is brought about. The instrumental thus, in effect, marks secondary agents (but not causees); verbs, however, never show person agreement with instrumental NPs. Common nouns are marked by *-ri* when ending in a vowel and with *-eri* when ending in a consonant; names and verbal topic agreement are marked by *ri*. With nouns ending in *-e*, as well as the plural marker *-ye*, there is variation regarding whether *-ri* or *-eri* is used, so that in the case of the plural marker both *-yeri* and *-yēri* occur. In passive-like constructions, it is not grammatical to reintroduce the agent as an instrumental; the agent simply remains in the clause in this case, though as a non-topic constituent.

- (30) a. *Ang visye Pila seygoley tibangeri yena.*  
*ang vis-ye Ø Pila seygo-ley tihang-eri yena.*  
 AT cut-3SG.F TOP Pila apple-P.INAN knife-INS 3SG.F.GEN  
 ‘Pila cuts an apple with her knife.’
- b. *Ang liboyya-ma badan nibanyeri (nibanyēri).*  
*ang liha-oy-ya=ma badan-Ø nihan-ye-ri (nihan-ye-eri)*  
 AT earn-NEG-3SG.M=enough father-TOP nihan-PL-INS (nihan-PL-INS)  
 ‘Father did not earn enough with his fruits.’
- c. *Ang lingya Mindan mebiras ri Kadijān.*  
*ang ling-ya Ø Mindan mehir-as ri Kadijān.*  
 AT climb.up-3SG.M TOP Mindan tree-P INS Kadijān  
 ‘Mindan climbs a tree with Kadijān’s help.’
- d. *Ri tavya gino ang Kan nimpur.*  
*ri tav-ya gino ang Kan nimpur-Ø*  
 INST become-3SG.M drunk A Kan wine-TOP  
 ‘Kan becomes drunk on the wine’,  
 or: ‘The wine, Kan becomes drunk on it.’

The instrumental may also be used for comitative meanings where the instrumental NP acts as a nominal adjunct describing an attribute of its antecedent head, for example:

- (31) *Ang pegayo sinyā kasuley b̄ariri nā?*  
 ang pega-yo sinyā-Ø kasu-ley bari-ri nā  
 AT steal-3SG.N who-TOP basket-P.INAN meat-INS 1SG.GEN

‘Who stole my basket of meat?’

In this case, *ḁ̄ b̄ari* is marked as an instrumental since it is an attribute of sorts to *ḁ̄ kasu*: the instrumental NP describes what its antecedent contains or entails more specifically: it is a basket *with* meat in it. Note, however, that this comitative use of the instrumental is different from mere accompaniment. Thus, it is not possible to say

- (32) \**Ang sahaya Ajān ri Pila.*  
 ang saha-ya Ø Ajān ri Pila  
 AT come-3SG.M TOP Ajān INS Pila

to express ‘Ajān comes (together) with Pila’. The sentence in (32) would instead imply that Pila helps Ajān to come, for example, because he has a sprained ankle and thus needs support to get around. To express accompaniment, instead, the preposition *ḁ̄ kayvo* ‘with, along, beside’ has to be used; the prepositional object appears in the locative case:

- (33) *Ang sahaya Ajān kayvo ya Pila.*  
 ang saha-ya Ø Ajān kayvo ya Pila  
 AT come-3SG.M TOP Ajān with LOC Pila

‘Ajān comes (together) with Pila.’

Theoretically, it should be possible as well to use the instrumental together with prepositions for some kind of prolocative meaning. The adposition would indicate the place *by way of* a motion is happening:

- (34) *Ang pukay manga luga labaneri.*  
 ang puk=ay.Ø manga luga lahan-eri  
 AT jump=1SG.TOP DIR top fence-INS

‘I jump over the fence.’

This use of the instrumental is unattested in previous translations into Ayeri, however, but could be considered a stylistic alternative—in the case of the example above, to a construction with the word for ‘over’, *ḁ̄ eyrarya*:

- (37) a. ... *nay ang mya rankyon sitanyās ku-netu.*  
 ... *nay ang mya rank=yon.Ø sitanya-as ku=netu*  
 ... *and AT be.supposed.to treat=3PL.N.TOP each.other-P like=brother*  
 ‘... and they shall treat each other like brothers.’<sup>5</sup> (Becker 2011a)
- b. ... *ang nunaya ku-vipin ...*  
 ... *ang nuna=ya.Ø ku=vipin ...*  
 ... *AT fly=3SG.M.TOP like=bird ...*  
 ‘... he (would) fly like a bird ...’ (Becker 2012: 14)

Strikingly, in example (37a),  $\text{netu}$  ‘brother’ in  $\text{ku-netu}$  ‘like brothers’ is not even inflected for plural; likewise,  $\text{ku-vipin}$  ‘like a bird’ in (37b) is not inflected for case. Both of these NPs form adverbials of manner, and this apparently prevented case marking in both cases. The instrumental as the case used to mark the how—means or helpers by which an action is brought about—would be expectable here.

Nouns may also be unmarked if they act as modifiers in a compound and the head is marked for the NP’s case and number, for instance:

- (38) *ralanyeri mapang*  
 ralan-ye-ri mapang  
 nail-PL-INS finger  
 ‘with the fingernails’

And lastly and probably most importantly, nouns appear superficially unmarked if topicalized, since the topic marker is  $-\emptyset$  if viewed systematically:

- (39) *Saru-nama, ang nupoyya veney aruno vās.*  
 sar-u=nama ang nupa-oy-ya veney- $\emptyset$  aruno vās  
 go-IMP=just AT hurt-NEG-3SG.M dog-TOP brown 2SG.P  
 ‘Just go, the brown dog won’t hurt you.’

#### 4.1.4 Prefixes on nouns

All of the nominal morphology we have so far dealt with in this section was suffixing. As mentioned in the previous section already (p. 67), however, there are also a number of prefixes that can be applied to nouns. I have just given two examples of the prefix  $\text{ku-}$  ‘like, as though’ above, but  $\text{ku-}$  applies not only to nouns, but can be combined with other parts of speech as well. As discussed in section 3.2.5 (p. 86 ff.), it behaves in the way of a special clitic in Zwicky (1977)’s terminology, since no corresponding full form exists in its place. To cite from the Ayeri translation of Kafka’s short story “Eine kaiserliche Botschaft” again:

- (40) ... *saylingyāng kovaro naynay, ku-ranyāng palung.*  
 ... sayling=yāng kovaro naynay ku=ranya-ang palung  
 ... progress=3SG.M.A easy also like=nobody-A else  
 ‘... he also got on easily, like nobody else.’ (Becker 2012: 12)

<sup>5</sup> The original English text this was translated from has “and should act towards one another in a spirit of brotherhood” (United Nations 1948: Article 1).

(41) a. *Ang lentava sa Tagāti diyan-ku.*  
ang lenta=va.Ø sa Tagāti diyan=ku  
AT sound=2.TOP P Tagāti worthy=like  
‘You sound like Mr. Tagāti.’

b. *Ang lentava sa Tagāti diyan-ku nay diranas yana.*  
ang lenta=va.Ø sa Tagāti diyan=ku nay diran-as yana  
AT sound=2.TOP P Tagāti worthy=like and uncle-P 3SG.M.GEN  
‘You sound like Mr. Tagāti and his uncle.’

c. *Sa lentavāng ku-Tagāti diyan.*  
sa lenta=vāng ku=Tagāti diyan  
PT sound=2.A like=Tagāti worthy  
‘Like Mr. Tagāti you sound.’

(42) a. *da-nanga kāryo*  
da=nanga kāryo  
such=house big  
'such a big house'

b. *edāyon nake*  
eda=ayon nake  
this=man tall  
'this tall man'

For the purpose of gaining at least a little insight into which types of compounds Ayer allows—besides endocentric compounds—I conducted a small (non-exhaustive) survey based on 130 compounds from the Ayer dictionary (Becker

Table 4.5: Compounds in the Ayeri dictionary (Becker 2016a) and their classification (n = 130)

Type	Harmonic		Disharmonic		Total	
Endocentric (N + N)	67	51.54%	2	1.54%	69	53.08%
Endocentric (N + Adj)	18	13.85%	4	3.08%	22	16.92%
Synthetic (V + N)	16	12.31%	4	3.08%	20	15.38%
Coordinative (N + N)	9	6.92%	—	—	9	6.92%
Exocentric (N + N)	1	0.77%	3	2.31%	4	3.08%
Unclear	6	4.62%	—	—	6	4.62%
Total	117	90.00%	13	10.00%	130	100%

2016a: Dictionary); Table 4.5 shows the various compound classes and the number of words for each. ‘Harmonic’ and ‘disharmonic’, respectively, refer to the order of elements; the order is ‘harmonic’ if it is following the normal constituent order of the language and ‘disharmonic’ if it is at odds with it (Gaeta 2008).

Unsurprisingly, the largest number of compound nouns in the sample were endocentric compounds of the regular kind, which means that, just like genitive attributes follow nouns, noun compounds are headed left. Especially compounds with adjectives are interesting insofar as this is also the normal order for free adjectives, so to illustrate, some tests will be necessary to show that these adjectives form a unit with the head noun and are unable to undergo comparison, for instance. Synthetic compounds exist in Ayeri and produce nouns. These are compounds in which “the modifying element in the compound is (usually) interpreted as an argument of the verb from which the head is derived” (Bauer 2001: 701). There are also a number of coordinative compounds; this group, however, is lexicalized and not productive. Exocentric compounds constitute the minority of the sample. In the following I will give examples for each type.

It needs to be noted that unlike Germanic languages, Ayeri does not allow compounds of arbitrary length to be strung together, like in the following ridiculous but no less real example from (former) German legislation (see, for instance, *Süddeutsche Zeitung* 2013):

(44) German:

*Rindfleischetikettierungsüberwachungsaufgabenübertragungsgesetz*  
 rind-fleisch-etikettierung-s-überwachung-s-aufgabe-n-übertragung-s-gesetz  
 cow-meat-labeling-LNK-supervision-LNK-duty-LNK-delegation-LNK-law  
 ‘law on the delegation of duties in the supervision of beef labeling’

In stark contrast, Ayeri allows only two elements in compounds. Furthermore, this section on compounds is located within the section on nouns because Ayeri almost only possesses compounds involving nouns, and the majority of these also results in a noun.

#### Endocentric compounds

To start with the largest group, endocentric/*tatpuruṣa* compounds, the bulk of these compounds combines two nouns, one of which is the head which is modified by a dependent noun. As Ayeri exhibits a rather strict head-first word order, it comes as no surprise, following Gaeta (2008), that most of these compounds follow this order strictly: the second noun modifies the first, which is opposite of how English, for instance, typically operates:

- (45) a.  $\text{betaynimpur}$  ‘grape’ ←  $\text{betay}$  ‘berry’ +  $\text{nimpur}$  ‘wine’  
 b.  $\text{karirayan}$  ‘vertigo’ ←  $\text{kar}$  ‘fear’ +  $\text{irayan}$  ‘height’<sup>6</sup>  
 c.  $\text{pikunanding}$  ‘mustache’ ←  $\text{piku}$  ‘beard’ +  $\text{nanding}$  ‘lips’  
 d.  $\text{tapayperin}$  ‘sunblind’ ←  $\text{tapay}$  ‘screen’ +  $\text{perin}$  ‘sun’

The example words in (45) show that the relationships between the modifier and the head are various: a grape is a berry *used* to make wine from (compare Bauer 2001: 702); vertigo is the fear *of* height; a mustache is a beard *located* over the lips (702); and a sunblind is a screen *against* the sun. Bauer (2001) mentions that “there may be special morphophonemic processes which apply between the elements of compounds”, such as “phonological merger[s] between the elements of the compound” (695). This also occasionally happens in Ayeri, as the next few example words show:

- (46) a.  $\text{avararan}$  ‘wetland’  
 ←  $\text{avan}$  ‘ground’ +  $\text{raro}$  ‘wet’ +  $\text{-an}$  (NMLZ)  
 b.  $\text{mehimitrang}$  ‘fiber tree’  
 ←  $\text{mehir}$  ‘tree’ +  $\text{mitrang}$  ‘hair, fiber’  
 c.  $\text{ningampinam}$  ‘bedtime story’  
 ←  $\text{ningan}$  ‘story’ +  $\text{pinam}$  ‘bed’  
 d.  $\text{padilamican}$  ‘gravitational force’  
 ←  $\text{padilan}$  ‘attraction’ +  $\text{mican}$  ‘force, power’

There is a modicum of alteration happening in all of the heads of the example words in (46), mostly nasals assimilating to the stop or nasal which the modifier begins with (/n/ + /p/ → /mp/, /n/ + /m/ → /m/), though  $\text{avararan}$

<sup>6</sup>  $\text{irayan}$ , however, is a transparent nominalization of  $\text{iray}$  ‘high’.

and မဲပိမိတြာ် *mehimitrang* even delete whole coda segments. Bauer (2001: 703) notes that very commonly, genitive and plural markers may form linking elements, though he also gives examples of languages which allow other case markers on the modifying element in languages with head-right order; individual languages may allow even more case inflection. However, this appears not to happen in Ayeri. The only element that comes up time and again in between the two halves of compounds is the nominalizer -an, which signifies that the head is being formed by a nominalized root, such as in ပါဠိကဗျာ် *padilamican*, where ပါဠိက *padilan* ‘attraction’ is a nominalization of ပါဠိ *padil-* ‘attract’, or in နိဂ္ဂမ္ပိနာ် *ningampinam*, where နိဂ္ဂ *ningan* ‘story’ is derived from the verb နိဂ္ဂ *ning-* ‘tell’. However, since Ayeri is head-first and possessive phrases are dependent marking, genitive or other case marking would be expected on the second element, not the first. Case marking on a compound, however, does not inflect just the modifier, but the whole NP:

- (47) *Ang ningya sipikanena koyababisena.*  
 ang ning-ya sipik-an-ena koyabahis-ena  
 AT talk-3SG.M.TOP keep-NMLZ-GEN book.day-GEN

‘He talks about keeping a journal.’

နိဂ္ဂမ္ပိနာ် *koyababisena* in this example is not to be interpreted as ‘book of day(s)’ but as ‘of a day-book’. Inflection between the parts of a compound can happen nonetheless, though. In compounds which are formed *ad hoc* or which are otherwise transparent in their composition (‘loose’ compounds), inflection often is deferred to the noun head noun instead of the edge of the compound as a whole; the modifier is treated as an adjunct in this case, and stays uninflected:

- (48) *Sa trayeng tipin ralanyeri mapang yena.*  
 sa tra=yeng tipin-Ø ralan-ye-ri mapang yena  
 PT scratch=3SG.F.A itch-TOP nail-PL-INS finger 3SG.F.GEN

‘The itch, she scratches it with her fingernails.’

Besides noun modifiers, there are also compounds where the modifier is an adjective. In classical Sanskrit terminology, this type is called *karmadhāraya* (Bauer 2001: 698–699).<sup>7</sup> Examples in Ayeri include:

- (49) a. ကာသဂိရာ် *kardangiray* ‘university’ ← ကာသံ *kardang* ‘school’ + ဂိရာ် *iray* ‘high’  
 b. မာရဗာရိ *marashari* ‘witticism’ ← မာရ *maras* ‘phrase’ + ဗာရိ *bari* ‘pithy’  
 c. ခိလ္လိကဏ် *silvanikan* ‘overview’ ← ခိလ္လိ *silvan* ‘view’ + ခိလ္လိကဏ် *ikan* ‘whole’  
 d. ဝိပိမာကာရ် *vipimakārya* ‘crow’ ← ဝိပိ *vipin* ‘bird’ + မာကာရ် *makārya* ‘black’

<sup>7</sup> Bauer (2001) also mentions that appositional compounds like *maid-servant*, *woman doctor* and *fighter-bomber* are counted in this category (699). Ayeri, however, does not possess such formations in particular.

In all of these cases, the adjective forms a unified lexeme with the head noun, hence it is not comparable, for example:

- |      |   |  |
|------|---|--|
| (50) | COMPARATIVE   | SUPERLATIVE  |
| a.   | <i>*kardangiray-eng</i><br><i>kardang-iray=eng</i><br><i>school-[high=COMP]</i><br><i>‘higher-school’</i> | <i>kardangiray-vā</i><br><i>kardang-iray=vā</i><br><i>school-*[high=SUPL]</i><br><i>‘highest-school’</i> |
| b.   | <i>*marashari-eng</i><br><i>maras-hari=eng</i><br><i>phrase-[pithy=COMP]</i><br><i>‘pithier-phrase’</i>   | <i>marashari-vā</i><br><i>maras-hari=vā</i><br><i>phrase-*[pithy=SUPL]</i><br><i>‘pithiest-phrase’</i>   |

In fact, it is possible to form *ကံသင်္ဂဇာဝ်* *kardangiray-vā* and *မာရသရိဝ်* *marasari-vā*, but they mean ‘most universities’ and ‘most witticisms’, that is, *-vā* here does not mark the adjectival part as a superlative form; the suffix modifies the noun–adjective compound as a whole: [*school-high*]=*most*, [*phrase-pithy*]=*most*. *-eng* ‘rather’ as a quantifier does not combine with nouns, which is why the first examples in (50ab) are both ungrammatical *per se*.

Since the meaning composed from noun–adjective compounds is often idiomatic, they also cannot be divided as shown above in (48), since a *ကံသင်္ဂဇာ* *kardangiray* ‘university’ is not a *ကံသင်္ဂ* *kardang* ‘school’ which is *ဇာဝ်* *iray* ‘high’ in the literal sense, but a school of the highest tier. *ကံသင်္ဂဇာဝ်* *kardangena iray* (school-GEN high), then, can only be interpreted in the literal sense, ‘of the high school’, but not as ‘of the university’, which thus can only be *ကံသင်္ဂဇာဝ်* *kardangirayena*.

In the sample, there were also a few compounds I categorized as noun–noun combinations, which look as though they violate head-first order. All of these involve *ဆိသံ* *sitang* ‘self’ as a modifier:

- |      |   |
|------|---|
| (51) | <p>a. <i>ဆိသံဂုဏ်</i> <i>sitanglentan</i> ‘vowel’<br/> ← <i>ဆိသံ</i> <i>sitang</i> ‘self’ + <i>ဂုဏ်</i> <i>lentan</i> ‘sound’</p> <p>b. <i>ဆိသံဂုဏ်</i> <i>sitangparonān</i> ‘self-confidence’<br/> ← <i>ဆိသံ</i> <i>sitang</i> ‘self’ + <i>ဂုဏ်</i> <i>paronān</i> ‘faith’</p> <p>c. <i>ဆိသံမိတ်</i> <i>sitangtenyan</i> ‘suicide’<br/> ← <i>ဆိသံ</i> <i>sitang</i> ‘self’ + <i>မိတ်</i> <i>tenyan</i> ‘death’</p> |
|------|---|

*ဆိသံ* *sitang* does not exist as a noun by itself in Ayeri, the word for ‘self’ is its nominalization *ဆိသံ* *sitangan*. Nonetheless, it looks like it could have plausibly been a noun once. However, this noun may have been grammaticalized into a reflexive morpheme of a more general kind, which in turn birthed the form *ဆိသံ* *sitangan*

as a renovation.<sup>8</sup> The reflexive *sitang* is used—as we have seen in the previous chapter—as a prefix, so there are two ways to interpret these formations: first, *sitang* may be the reflexive prefix here and thus the compound follows the normal syntactic order; or second, the order of elements is reversed and thus may reflect an earlier stage of Ayeri where *sitang* was still a noun and modifiers could still appear in front of their heads, at least optionally so (Gaeta 2008: 133–137).

There are a number of genuinely reversed endocentric compounds as well, however, in which the modifier comes first and the head last. Since there are only a few of these to date, I will give all of them in the following example:

- (52) a. *baripata* ‘ground meat’  
 ← *bari* ‘meat’ + *pata* ‘mash’  
 b. *kayvolentan* ‘consonant’  
 ← *kayvo* ‘with’ + *lentan* ‘sound’  
 c. *māvaganeng* ‘mother’s siblings’  
 ← *māva* ‘mother’ + *ganeng* ‘siblings’  
 d. *matinanding* ‘labia’  
 ← *matikan* ‘hot’ + *nanding* ‘lips’  
 e. *muyavirang* ‘brass’  
 ← *muya* ‘false’ + *avirang* ‘gold’  
 f. *tonisaytang* ‘self-assured’  
 ← *tonisa* ‘assured’ + *sitangan* ‘self’

Given the discussion of *sitang* above, one word among the examples above that is not too clear is *tonisaytang*, which appears to contain a deviant form of either *sitang* or *sitangan*, which is preceded by the adjective *tonisa* ‘assured, ascertained’.

All of the previously mentioned compounds involving nominal elements formed nouns, though, there are also a few denominal compounds in the sample. This process is not productive, however, and interestingly, only noun–adjective combinations appear in this group:

<sup>8</sup> A little bit of language history would certainly simplify things here and lend them credence. Let us simply assume that *sitang* used to be a noun meaning something like ‘self’ at a previous stage of Ayeri and was repurposed as a reflexive prefix. Lehmann (2015) quotes a few examples of what he calls ‘autophoric’ nouns that came to be used as reflexive pronouns in their respective language: “Typical examples are Sanskrit *tan* ‘body, person’ and *ātmán* ‘breath, soul’, Buginese *elena* ‘body’, Okinawan *dūna* ‘body’, !Xu *l’esi* ‘body’, Basque *burua* ‘head’, Abkhaz *a-xə* ‘the head’. In their respective languages, all these nouns are translation equivalents of English *self*” (45–46). Thus, it would not be out of line at all to assume such a grammaticalization path for Ayeri as well.

- (53) a. ၶီၵုၵ်း *mirampaluy* ‘otherwise’  
 ← ၶီၵ်း *miran* ‘way’ + ၵုၵ်း *palung* ‘different’
- b. ပါးၵၢၵ်း *padabanya* ‘insane’  
 ← ပါး *padang* ‘mind’ + ၵၢၵ်း *banaya* ‘sick’
- c. တဲၵ်း *tenkarisa-* ‘be frightened to death’  
 ← တဲ *ten* ‘life’ + ၵ်း *karisa* ‘frightened’

ၶီၵုၵ်း *mirampaluy* is an adverb, the modifier probably a mangling of ၵုၵ်း *palung*; ပါးၵၢၵ်း *padabanya* is an adjective meaning ‘insane’ rather than the expected ‘insanity’ (instead: ပါးၵၢၵ်း *padabanyān*); and တဲၵ်း *tenkarisa-* acts as a verb, possibly from conversion or reinterpretation, since the suffix *-isa* also forms morphological causatives of a number of verbs. Besides these irregularities, there is also at least one noun compound which uses a postposition as an adjectival modifier:

- (54) ၵိၵ်း *silvankayvay* ‘blindness’ ← ၵိၵ်း *silvan* ‘sight’ + ၵိၵ်း *kayvay* ‘without’

This compound must be derived from the phrase ၵိၵ်း *silvanya kayvay* ‘without sight’ (see-NMLZ-LOC without), though here as well, the word roots are simply juxtaposed, as noted above is the common way to form compounds in Ayeri.

#### Synthetic compounds

According to Bauer (2001), (semi-)synthetic compounds, or verbal(-nexus) compounds, are compounds that have “been variously defined as being based on word-groups or syntactic constructions (Botha 1984: 2), or as compounds whose head elements are derived from verbs (Lieber 1994: 3607)” (Bauer 2001: 701). Examples of this type in English would include *truck-driver*, *peace-keeping*, and *home-made*. He mentions also that synthetic compounds have been mainly discussed with regards to Germanic languages, but that according to Lieber (1994: 3608), the phenomenon is much more widespread. Ayeri possesses compounds like this as well, and the regular case again follows the constituent order, here that of verbs and nouns: Ayeri is a VO language, and thus the verb as the head of the compound is usually found on the left side with its nominal modifier following it (compare Gaeta 2008: 129–133):

- (55) a. ၵိၵ်း *anlāgonan* ‘pronunciation’  
 ← ၵိၵ်း *anl-* ‘bring’ + ၵိၵ်း *agonan* ‘outside’
- b. ၵိၵ်း *napakaron* ‘acid’  
 ← ၵိၵ်း *nap-* ‘burn’ + ၵိၵ်း *karon* ‘water’
- c. ၵိၵ်း *napaperin* ‘sunburn’  
 ← ၵိၵ်း *nap-* ‘burn’ + ၵိၵ်း *perin* ‘sun’
- d. ၵိၵ်း *telbasasān* ‘waysign’  
 ← ၵိၵ်း *telba-* ‘show’ + ၵိၵ်း *sasān* ‘way’

The relations between the verb and the noun are various again, that is, the nominal modifier is not simply the direct object of the verb: to pronounce something means to bring it *to* the outside; a sunburn is a burn *caused by* the sun; and a waysign shows the way (မန္တရ် *sasān* is the object here). Even though ကရုဏ် *karon* may serve as an agent (or a causer) of the burning effect of acid (similarly for နာပာပရိ *napaperin* ‘sunburn’), the verb-first order is justified here as well, since verbs always go first in Ayeri sentences, and any other NPs, whether actor or undergoer, are following.

Just as with endocentric compounds, there are a number of seeming exceptions to the verb-first order of synthetic compounds as well. These are just as far and few between, however, and whether they should all be counted as noun–verb combinations is also questionable as they appear to all be formed with nominalized verbs. The verbal element may thus be only indirectly verbal for the purposes of compounding. If interpreted as noun–noun combinations, the nominal first element would reasonably form the head again for some of the below example words.

- (56) a. မာရိပုဏ္ဏယံ *maripuntayam* ‘spread’  
 ← မာရိ *marin* ‘surface’ + ပုဏ္ဏ *punta-* ‘stroke’ + ယံ *-yam* (DAT)
- b. မာရိပုဏ္ဏယံ *sasanlekān* ‘labyrinth’  
 ← မန္တရ် *sasān* ‘way’ + လော *leka-* ‘guess’ + ယံ *-an* (NMLZ)
- c. မာရိပုဏ္ဏယံ *selangnunān* ‘plane’  
 ← မာရိ *selang* ‘machine’ + နုနာ *nuna-* ‘fly’ + ယံ *-an* (NMLZ)
- d. မာရိပုဏ္ဏယံ *sinturān* ‘radio’  
 ← မာရိ *sinto* ‘wave’ + တုရ *tura-* ‘send’ + ယံ *-an* (NMLZ)

မာရိပုဏ္ဏယံ *maripuntayam* is special in that it contains the dative suffix ယံ *-yam* which is lexicalized as part of the word: something made or intended for spreading on a surface. A few more such verbal derivations can be found, though not compounds, among others:

- (57) a. ဂရေယံ *grenyam* ‘extremity’ ← ဂရေ *gren-* ‘reach out’  
 b. လူဂယံ *lugayam* ‘password’ ← လူဂ *luga-* ‘go through’  
 c. မာယံ *sabayam* ‘future’ ← မာ *saba-* ‘come’

There is also မာရိပုဏ္ဏ *maripunta-* ‘spread over’ as the verb corresponding to မာရိပုဏ္ဏယံ *maripuntayam*, though its meaning is less specific. Here as well, however, the verbal part is last instead of first. For the other example words (56b–d), an interpretation of the second part as a deverbal noun is possible: a labyrinth as a way or path which requires guessing, a plane a machine for flight, and radio as a sending of waves. In the latter case, မာရိပုဏ္ဏ *sinturān*, however, the head is still on the wrong side even if one interprets all of the above examples as noun–noun compounds with a deverbal element.

*Coordinative compounds*

Coordinative compounds are a very small group among the sample drawn from the dictionary, and not a very productive one. Bauer (2001) defines this class as having “two or more words in a coordinate relationship, such that the entity denoted is the totality of the entities denoted by each of the elements” (699). He cautions that they are very easy to confuse with appositional (also *karmadhāraya*) compounds in that both types of compound allow inserting an *and* between both elements. The following nominal coordinative compounds are included in the dictionary sample:

- (58) a.  $\text{bāmā}$  ‘mom-and-dad’  
 ←  $\text{bā(bā)}$  ‘dad’ +  $\text{mā(mā)}$  ‘mom’  
 b.  $\text{pruynapay}$  ‘seasoning’  
 ←  $\text{pruy}$  ‘salt’ +  $\text{napay}$  ‘pepper’  
 c.  $\text{sapayyila}$  ‘hands-and-feet’  
 ←  $\text{sapay}$  ‘hand’ +  $\text{yila}$  ‘foot’  
 d.  $\text{simileno}$  ‘horizon’  
 ←  $\text{simil}$  ‘country’ +  $\text{leno}$  ‘sky’  
 e.  $\text{sitemrugon}$  ‘thunderstorm’  
 ←  $\text{sitem}$  ‘lightning’ +  $\text{rugon}$  ‘thunder’  
 f.  $\text{vekamdekey}$  ‘dishes’  
 ←  $\text{vekam}$  ‘plate’ +  $\text{dekey}$  ‘fork’

None of the two elements recognizably forms the head in these examples, but both elements are typical exponents of the thing the compound signifies. Bauer (2001: 699) mentions that coordinative adjective compounds are rare, or at least rarely documented in the grammars he surveyed. In the sample I took, only the following compound is included, which forms a noun from the combination of two adjectives, insofar it is relevant to this section even though the component parts are not nouns:

- (59)  $\text{makagisu}$  ‘twilight’ ←  $\text{maka}$  ‘light’ +  $\text{gisu}$  ‘dark’

The sample also includes the following two words, however, which are neither made up from nouns, nor do they form a noun in combination. Instead, they are technically verbs combining to form directional adverbs and have been exceptionally included here for completeness:

- (60) a.  $\text{mangasaba}$  ‘towards’ ←  $\text{manga-}$  ‘move’ +  $\text{saba-}$  ‘come’  
 b.  $\text{mangasara}$  ‘away’ ←  $\text{manga-}$  ‘move’ +  $\text{sara-}$  ‘go’

*Exocentric compounds*

In exocentric compounds, the modifier is not a hyponym of its head (Bauer 2001: 700), which means that the modifier is not describing a property that more closely determines its head. So while a *dog kennel* is a type of kennel made for dogs, the head of an *egghead* is neither for eggs, nor containing eggs, nor made of eggs; instead, it refers to an egg-shaped skull metaphorically. And while a *bluecollar* may wear a blue shirt professionally, the referent it signifies is not a type of collar, but the relationship is metonymical in that the blue collar is part of the guise of the signified entity as a whole. The sample from the Ayeri dictionary contains a few compounds of this kind as well, though again, it is not a very productive group:

- (61) a. ၼံၼ်ၼ်ၼ် *avanyonang* ‘artery’  
           ← ၼံၼ် *avan* ‘bottom, down’ + ၼ်ၼ် *yonang* ‘stream’  
       b. ၼံၼ်ၼ် *baytandevo* ‘headache’  
           ← ၼံၼ် *baytang* ‘blood’ + ၼ် *devo* ‘head’  
       c. ၼံၼ်ၼ် *linyonang* ‘vein’  
           ← ၼံၼ် *ling* ‘top, up’ + ၼ်ၼ် *yonang* ‘steam’  
       d. ၼံၼ်ၼ် *sindaynanga* ‘address’  
           ← ၼံၼ် *sinday* ‘number’ + ၼ် *nanga* ‘house’

What is striking here is that only one out of four examples shows the expected head-left order: ၼံၼ်ၼ် *sindaynanga*. The other three examples all have the head component on the right side, preceded by a modifier. However, what all of these have in common, is that they are only metaphorically or metonymically describing the thing they signify: veins and arteries are not literally streams going up or down (they are a kind of stream flowing in different directions, however, so these are probably on the borderline between exocentric and endocentric); a headache is related to the head, but has not directly to do with being made of or containing blood (the rationale behind this being a superstition that you have too much blood in your head, which is said to cause the pain); and a house number may be part of an address, but is in a *pars pro toto* relationship to it.

*A few mysterious cases*

The following words from my sample were either undeterminable as to their composition due to parts of the word not being clear regarding one of their constituent parts, either because I tweaked the constituent so much as to not be readily recognizable anymore, or because I forgot to make an entry in the dictionary, or even deleted or changed that. The words in question are the following:

- (62) a. ခါဇာန်ဗဲ *batangiman* ‘mosquito’ ← ခါဇာန် *baytang* ‘blood’ + ?  
 b. ခါဇာန် *kirinalang* ‘avenue’ ← ခါဇာန် *kirin* ‘street’ + ?  
 c. ခါဇာန် *ningambakar* ‘telltale’ ← ခါဇာန် *ningan* ‘story’ + ?  
 d. ခါဇာန် *ragayesuy* ‘grid’ ← ခါဇာန် *ragan* ‘line’ + ?  
 e. ခါဇာန် *teraymino* ‘melancholic’ ← ? + ခါဇာန် *mino* ‘happy’  
 f. ခါဇာန် *vetaysano* ‘fare’ ← ? + ခါဇာန် *sasān* (earlier ခါဇာန် *sasano*) ‘way’

For all of the components represented by a question mark, there is no corresponding dictionary entry. At least in ခါဇာန်ဗဲ *baytangiman*, the \*ခါဇာန် *\*iman* part looks as though it could be a noun due to the ခါဇာန် *-an* nominalizer suffix. \*ခါဇာန် *\*teray* in ခါဇာန် *teraymino* might also be an adjective supposed to mean ‘sad’ (which would make it an adjectival coordinative compound), although the dictionary entry for that is ခါဇာန် *giday*. Even though parts of all these words are unclear, they all seem to follow the correct syntactic order, judging by those parts that are identifiable. And even in the case of ခါဇာန် *vetaysano*, which is missing the first part, it can be reasonably assumed that the identifiable part, \*ခါဇာန် *\*sano*, is the modifier, and \*ခါဇာန် *vetay* may have once been intended to mean ‘money’ or ‘fee’ or something along these lines.

With the exception of ခါဇာန် *ningambakar*, all of the mystery words were entered into the dictionary in 2006. Digging through old archives and translations, I could determine at least that \*ခါဇာန် *\*bakar* was once intended to mean ‘lie’, and \*ခါဇာန် *\*teray* was indeed meant to mean ‘sad’.

#### 4.1.6 Reduplication

Wiltshire and Marantz (2000) write that it has been suggested that reduplication serves an iconic function, “with the repetition of phonological material indicating a repetition or intensity in the semantics” (561), so with regards to nouns it mainly serves to indicate plurality of various kinds. However, they find that in fact, reduplication serves all kinds of functions, also ones without iconic meanings, and mention Agta, an Austronesian language of the Philippines, which uses reduplication to form diminutives (Healey 1960: 6–9). As we have seen in section 3.2.3 above, so does Ayeri, and it is justified in doing so since there is real-world evidence for this use of reduplication. Examples for diminutive reduplication in Ayeri include:

- (63) a. လိမ္မာ *limu* ‘shirt’ → လိမ္မာလိမ္မာ *limu-limu* ‘little shirt’  
 b. ဘာ *nanga* ‘house’ → ဘာဘာ *nanga-nanga* ‘little house’  
 c. ခာ *sapay* ‘hand’ → ခာခာ *sapay-sapay* ‘little hand’  
 d. ခါဇာန် *veney* ‘dog’ → ခါဇာန်ခါဇာန် *veney-veney* ‘little dog’

Diminutive reduplication involves full stem reduplication in Ayeri. Besides the productive use of reduplication for diminutive marking, there are a number of diminutive formations which have been lexicalized, such as in the following examples:

- (64) a. ၎်အီ agu ‘chicken’ → ၎်အီ:၎်အီ agu-agu ‘chick’  
 b. အံ့ gan ‘child’ → အံ့:အံ့ gan-gan ‘grandchild’  
 c. ကန်ပံး pasing ‘tube’ → ကန်ပံး:ကန်ပံး pasing-pasing ‘straw’  
 d. ပိယံ poyu ‘cheek; bacon’ → ပိယံ:ပိယံ poyu-poyu ‘butt’

There are also at least two documented cases where the reduplicated root is not a noun, but the reduplication results in a noun:

- (65) a. နွံကံ kusang ‘double (adj.)’ → နွံကံ:နွံကံ kusang-kusang ‘model’  
 b. ငံး veḥ- ‘build’ → ငံး:ငံး veḥa-veḥa ‘tinkering’

Reduplicated nouns behave like regular nouns with regards to inflection, that is, they receive prefixes and suffixes just like the simplexes from which they are derived:

- (66) *Puco mino veney-veneyang.*  
 puk-yo mino veney~veney-ang  
 jump-3SG.N happily DIM~dog-A

‘The little dog is jumping happily.’

In this example, the reduplicated noun ငံး:ငံး *veney-veney* is marked as an agent in that the agent suffix :၎် *-ang* is appended to the noun as a unit *after* reduplicating the noun stem. In other words, the following formation in which the root is reduplicated along with its declension suffix is ungrammatical for the purpose of forming a diminutive:

- (67) \*ငံး:ငံး:၎် \*veneyang-veneyang

Likewise, the reduplicated form is not treated in the way an endocentric compound would be, so case and plural marking cannot be appended to the first element:

- (68) \*ငံး:ငံး:၎် \*veneyang veney

While ordinary nouns undergo full reduplication to form a diminutive, in compounds, only the head is reduplicated, unless the compound is strongly lexicalized or has an idiomatic meaning going beyond that of its components. The following example shows the simple case of a transparent endocentric compound:

- (69) *Ya yomayo mehir-mehirang seygo veno kay pang nanga nana.*  
 ya yoma-yo mehir~mehir-ang seygo veno kay pang nanga-Ø nana  
 LOCT be-3SG.N DIM~tree-A apple pretty three back house-TOP IPL.GEN

‘There are three pretty little apple trees behind our house.’

In this example, being endearing or otherwise small is treated as a property of the head, မ်းမိာ် *mehir* ‘tree’, not of the whole compound မ်းမိာ်နီၤ *mehirseygo* ‘apple tree’, or the dependent, နီၤ *seygo* ‘apple’—after all, an apple tree which is small is rather a small tree with apples on it than a tree with small apples. The avoidance of the fully reduplicated form မ်းမိာ်နီၤမ်းမိာ်နီၤ *mehirseygo-mehirseygo* is probably related to the notion of economy of expression.

#### 4.1.7 Nominalization

Some accidental ways of deriving nouns have been mentioned above, for instance, some reduplicated non-nominal roots like နီၤနီၤ *kusang* ‘double’ or ဖ်းဃုး *veha-* ‘build’ may form nouns. However, Ayeri also has some dedicated morphology to derive nouns from other parts of speech. The most common and highly productive way to derive a noun, is the suffix -an. The examples in (70) illustrate some derivations from verbs, and (71) shows derivations from adjectives to nouns. As နီၤနီၤ *kuban* ‘oar’ shows, the nominalization may have an idiomatic meaning.

- (70) a. ခာၣ်နီၤ *balang-* ‘search (v.)’ → ခာၣ်နီၤနီၤ *balangan* ‘search (n.)’  
 b. နီၤနီၤ *kub-* ‘row’ → နီၤနီၤနီၤ *kuban* ‘oar’  
 c. ဂိၣ်း *rig-* ‘draw’ → ဂိၣ်းနီၤ *rigan* ‘drawing’  
 d. ဖ်းဃုး *veh-* ‘build’ → ဖ်းဃုးနီၤ *vehan* ‘building’
- (71) a. မ်းမိာ် *apitu* ‘pure’ → မ်းမိာ်နီၤ *apituan* ‘purity’  
 b. ဂိၣ်း *gira* ‘urgent’ → ဂိၣ်းနီၤ *girān* ‘hurry’  
 c. ပါၣ်း *pakis* ‘serious’ → ပါၣ်းနီၤ *pakisan* ‘seriousness’  
 d. ဝါၣ် *vapa* ‘skillful’ → ဝါၣ်နီၤ *vapan* ‘skill’

Occasionally, it may even happen that a noun is derived from a noun with a related but sometimes more basic meaning using the nominalizer -an. This process, however, is not productive, so compared to deverbalization and deadjectivization, examples of this derivation strategy are few.

- (72) a. မ်းမိာ် *ajam* ‘toy’ → မ်းမိာ်နီၤ *ajaman* ‘game’  
 b. နီၤနီၤ *kelang* ‘chain’ → နီၤနီၤနီၤ *kelangan* ‘connection’  
 c. နီၤ *nanga* ‘house’ → နီၤနီၤ *nangān* ‘household’  
 d. မ်း *ten* ‘life’ → မ်းနီၤ *tenan* ‘soul’

There are also some apparent nominalizations in :ဆ်း -*am* and :ဆ်း -*ang*, although these are irregular and non-productive:

- (73) a. :ဆ်း *aja*- ‘play’ → :ဆ်း *ajam* ‘toy’  
 b. :ဆ်း *gin*- ‘drink’ → :ဆ်း *ginam* ‘glass’  
 c. :ဆ်း *mik*- ‘poison (v.)’ → :ဆ်း *mikam* ‘poison (n.), venom’  
 d. :ဆ်း *nuna*- ‘fly’ → :ဆ်း *nunam* ‘feather’
- (74) a. :ဆ်း *bayha*- ‘rule’ → :ဆ်း *bayhang* ‘government’  
 b. :ဆ်း *bapa* ‘remaining’ → :ဆ်း *bapang* ‘remainder’  
 c. :ဆ်း *kada*- ‘collect’ → :ဆ်း *kadang* ‘committee; alliance’  
 d. :ဆ်း *mima* ‘possible’ → :ဆ်း *mimang* ‘access’

Agentive nouns can be formed from regular nouns with the suffix :ဃး -*maya*, compare the examples in (75). An epenthetic /a/ may be introduced to break up consonant clusters that would otherwise be either difficult to pronounce or violating phonotactics. When the stem of the word the agentive suffix is attached to ends in a consonant or /Ca/, it is also often found fused with the root, sometimes with the first /a/ of -*Caya* lengthened, see (76). Specifically feminine agentive nouns can be derived with the related suffix :ဃး -*vaya*; two examples are given in (77).

- (75) a. :ဆ်း *anl*- ‘bring’ → :ဆ်း *anlamaya* ‘waiter’  
 b. :ဆ်း *hora* ‘sin’ → :ဆ်း *horamaya* ‘sinner’  
 c. :ဆ်း *nasy*- ‘follow’ → :ဆ်း *nasyamaya* ‘follower’  
 d. :ဆ်း *teba*- ‘bake’ → :ဆ်း *tebamaya* ‘baker’
- (76) a. :ဆ်း *asa*- ‘travel’ → :ဆ်း *asāya* ‘traveler’  
 b. :ဆ်း *ibut*- ‘trade’ → :ဆ်း *ibutaya* ‘trader, merchant’  
 c. :ဆ်း *lant*- ‘lead’ → :ဆ်း *lantaya* ‘leader; driver’  
 d. :ဆ်း *tang*- ‘listen’ → :ဆ်း *tangaya* ‘listener’
- (77) a. :ဆ်း *gan* ‘child’ → :ဆ်း *ganvaya* ‘governess’  
 b. :ဆ်း *lanya* ‘king’ → :ဆ်း *lanvaya* ‘queen’

Besides these, there is also a derivative suffix for makers of things, :ဆ်း -*ati* (contracting to /atʃ/ -*ac* before a vowel), though this is not too productive, and sometimes irregular, as :ဆ်း *sirtangati* ‘youth’ shows:

- (78) a. :ဆ်း *gindi* ‘poem’ → :ဆ်း *gindati* ‘poet’  
 b. :ဆ်း *sirtang* ‘young’ → :ဆ်း *sirtangati* ‘youth’  
 c. :ဆ်း *taban*- ‘write’ → :ဆ်း *tabanati* ‘scribe’  
 d. :ဆ်း *vehim* ‘piece of clothing’ → :ဆ်း *vehimati* ‘tailor’

A few instances also exist where a tool of sorts is derived with a suffix  $\text{ᠠᠨ}$  *-an*, which is related to the instrumental suffix  $\text{ᠡᠷᠢ}$  *-eri* in combination with the nominalizer  $\text{ᠠᠨ}$  *-an*:

- (79) a.  $\text{ᠭᠣᠷ}$  *gur-* ‘turn’ →  $\text{ᠭᠣᠷᠠᠨ}$  *guryan* ‘coil, cylinder’  
 b.  $\text{ᠮᠢᠰ}$  *mis-* ‘behave’ →  $\text{ᠮᠢᠰᠢᠷᠠᠨ}$  *miseryan* ‘method, strategy’  
 c.  $\text{ᠨᠠᠫ}$  *nap-* ‘burn’ →  $\text{ᠨᠠᠫᠢᠷᠠᠨ}$  *naperyan* ‘tinder’  
 d.  $\text{ᠫᠠᠷ}$  *pra-* ‘glitter, gleam’ →  $\text{ᠫᠠᠷᠢᠷᠠᠨ}$  *praryan* ‘spark’

While  $\text{ᠠᠨ}$  *-an* derives nouns from verbs to produce nouns that act as such in every way, it may sometimes be preferable to refer to the action as such by a noun, compare in English:

- (80) a. Manhattan is famous for its tall **buildings**.  
 b. **Building** a house is an expensive endeavor.

In (80a), *building* is simply a noun derived from the verb *build*. It acts as a noun in every way, for example, it can serve as a subject and object, it can be pluralized, it can take determiners, and can be modified by adjectives. The form of *building* in (80b), however, is a gerund, and as such underlies the restriction that it cannot be pluralized (Payne 1997: 35). As we have seen at the beginning of this section on nominalization, Ayeri can derive  $\text{ᠪᠡᠬᠠᠨ}$  *vehan* ‘building, construction’ from the verb  $\text{ᠪᠡᠬ}$  *veh-* ‘build’, which acts like every other common noun, much like in the English example in (80a):

- (81) a. *Lesāra*                      *sirimang*   *vehānreng*                      *tado*.  
           lesa-ara                      sirimang   vehān-reng                      tado  
           collapse-3SG.INAN   about.to   building-A.INAN   old  
           ‘The old building is about to collapse.’  
 b. *Le*                      *vacyang*                      *eda-vehān*.  
           le                      vac=yang                      eda=vehān-Ø  
           PT.INAN   like-1SG.A   this=building-TOP  
           ‘This building, I like it.’  
 c. *Ang*   *latayo*                      *bayhang*                      *vehānyeley*                      *yona*.  
           ang   lata-yo                      bayhang-Ø                      vehān-ye-ley                      yona  
           AT   sell-3SG.N   government-TOP   building-PL-P.INAN   3SG.N.GEN  
           ‘The government is selling its buildings.’  
 d. *Le*                      *ming*   *kuysāran*                      *vehān-kay*                      *dirasyam*                      *ran*.  
           le                      ming   kuysa-aran                      vehān-Ø=kay                      diras-yam                      ran  
           PT.INAN   can   compare-3PL.INAN   building-TOP=few   splendor-DAT   3SG.INAN.GEN  
           ‘Few buildings can compare to its splendor.’

The above examples condense several properties into one for illustration. Thus, (81a) shows that ၵုၵ်း *vehān* can serve as basically a subject of a clause, and that it can as well be modified by an adjective—the choice of adjectives is not subject to any distributional restrictions other than those imposed by the semantic frame of HOUSE. In the next example, (81b), ၵုၵ်း *vehān* serves as the object of the clause and is being determined by the demonstrative prefix ၵုၵ်း *eda-* ‘this’. The third example, (81c), shows ၵုၵ်း *vehān* both pluralized and modified by a possessive pronoun, ၵုၵ်း *yona* ‘of it’. And finally, in (81d) we see ၵုၵ်း *vehān* quantified by the suffix ၵုၵ်း *-kay* ‘few’.

Similar to the English example in (80b), Ayeri can also derive nouns from the participle of a verb describing the action as such—a gerund. For an example, I will again draw on the Ayeri translation of Kafka’s short story “Eine kaiserliche Botschaft” (Becker 2012: 2, 14):

- (82) ... *nay ang pətangongva*                      *ankyu haruyamanas*                      *nanang megayena*  
 ... *nay ang pə-tang-ong=va.Ø*                      *ankyu haru-yam-an-as*                      *nanang mega-ye-na*  
 ... and AT NFUT-hear-IRR=2SG.TOP truly beat-PTCP-NMLZ-P great fist-PL-GEN  
*yana kunangya vana.*  
*yana kunang-ya vana*  
 3SG.M.GEN door-LOC 2SG.GEN

‘... and you would indeed hear his magnificent beating at your door very soon.’

The annotations to this translation contain a comment on the grammatical rules which operate in this passage, more specifically also on the gerund derivation ၵုၵ်း *haruyaman* ‘beating’:

Furthermore, I wrote *haruyaman* ‘beating’ instead of *haruan* ‘beat(ing)’ because I wanted to emphasize the process of beating as an incomplete action. This is possible here because the word is not topicalized and neither is it marked as a dative, which would also require *haruyamanyam* ‘beat-PTCP-NMLZ-DAT’ to become *haru-anyam* ‘beat-NMLZ-DAT’ (the participle marker *-yam* is derived from the dative case ending *-yam*). (Becker 2012: 14–15)

We can read from this description that the participle marker in Ayeri has possibly been grammaticalized from the dative case marker, or that it is at least synchronically homonymous. In order for case marking to operate, this formation has to be nominalized, which is done the usual way by appending ၵုၵ်း *-an*, thus yielding the suffix cluster ၵုၵ်း *-yaman* for the derivation of verbs as gerunds. If the gerund is marked for dative case, the suffix cluster ၵုၵ်း *\*-yamanyam* basically undergoes haplology to a simple nominalized form with the suffix cluster ၵုၵ်း *-anyam*:

- (83) *haru-*                      *haruyam*                      *haruyaman*                      *\*haruyamanyam*                      *haruanyam*  
 haru- → haru-yam → haru-yam-an → haru-yam-an-yam → haru-an-yam  
 beat                      beat-PTCP                      beat-PTCP-NMLZ                      beat-PTCP-NMLZ-DAT                      beat-NMLZ-DAT

The comment on the translation also makes a little note on the gerund being possible because the word is not topicalized. This is based on an old rule that gerunds cannot be topicalized unless nominalized first, however, usage has since changed so that earlier,  $\text{ᑭᐱᑦᑭᐱᑦ}$  *haruyam* would have constituted the gerund form, while even by the time of translating the short story, it had changed to  $\text{ᑭᐱᑦᑭᐱᑦ}$  *haruyaman*. Thus, it is no surprise to see the following example, from the partial translation of Saint-Exupéry's story "Le petit prince" (Becker 2015 [2013]: 3, 13):

- (84) *Sa koronyang palungyaman na Baysānterpeng nay na Bayokivo*  
 sa koron=yang palung-yam-an-Ø na Baysānterpeng nay na Bayokivo  
 PT knew=ISG.A distinguish-PTCP-NMLZ-TOP GEN Realm.Middle and GEN Spring.Little  
*menaneri nivānyena.*  
 menan-eri nivān-ye-na  
 first-INS glimpse-PL-GEN

'I knew how to distinguish between China and Arizona at first sight.'

A more literal translation of this sentence would be 'The distinguishing of China and Arizona, I knew it at first sight', so the whole passage  $\text{ᑭᐱᑦᑭᐱᑦ} - \text{ᑭᐱᑦᑭᐱᑦ}$  *palungyaman ... na Bayokivo* forms the topic of the sentence here, headed by the gerund  $\text{ᑭᐱᑦᑭᐱᑦ}$  *palungyaman* 'distinguishing'. According to the old rule obliquely quoted in the comment to the passage in (82), this should not be possible. As said before, though, usage has changed.

A rule we can gather from the above example from Saint-Exupéry is that gerunds are treated as animate nouns. Since they are impersonal, they trigger neuter agreement on verbs. They can also be the objects of sentences. The passage in (82) furthermore illustrates that gerunds can be modified by adjectives. The following example shows a gerund used as an agent—basically a subject—as well (Becker 2014):

- (85) *Dilayamanang kalamena babalanas ayonena ...*  
 dila-yam-an-ang kalam-ena bahalan-as ayon-ena ...  
 find.out-PTCP-NMLZ-A truth-GEN goal-P man-GEN ...

'(If) finding out the truth is the goal of the man ...'

What all the passages on gerunds quoted before show is that gerunds in Ayeri do not behave like transitive verbs as in English. Thus, what would be the object of the former verb appears in the genitive case in Ayeri. As in English, however, gerunds in Ayeri cannot be pluralized:

- (86) \**Noyo vebayamanjang nangayena.*  
 noyo veba-yam-an-ye-ang nanga-ye-na  
 expensive build-PTCP-NMLZ-PL-A house-PL-GEN

'\*The buildings of houses are expensive.'

It is possible, however, to quantify gerunds insofar as the quantifier does not imply countable quantities of the action. Moreover, it is possible for gerunds to be modified by possessors. The following two sentences exemplify this use:

- (87) *Ang lugayan delacamanas-ikan kayanya pang.*  
 ang luga=yan.Ø delak-yam-an-as=ikan kayan-ya pang  
 AT go.through=3PL.M.TOP suffer-PTCP-NMLZ-P=much war-LOC after

‘They went through a lot of suffering after the war.’

- (88) *Krico malyyamanang muya tan.*  
 krit-yo maly-yam-an-ang muya tan  
 annoy-3SG.N sing-PTCP-NMLZ-A wrong 3PL.M.GEN

‘Their off singing is annoying.’

## 4.2 Pronouns

Ayeri possesses different kinds of pronouns in the sense that there is a closed class of words which contains anaphora of various types—personal pronouns, demonstrative pronouns, interrogative pronouns, relative pronouns, as well as reflexive and reciprocal expressions. Each class of pronouns will be discussed in the following.

### 4.2.1 Personal pronouns

As Table 4.6 shows, Ayeri possesses quite a large number of personal pronouns with (maybe unnaturally) little syncretism between the different paradigm slots overall (the second person is a notable exception); there are also no gaps in the paradigm. Ayeri’s personal pronouns reflect the grammatical features also found in nouns, that is, number, gender, and case, and person is added to that. The individual forms range from completely fused to fully transparent even within the same case paradigm, for instance, ꠘꠞ ꠘāꠞ ‘(to/for) me’ (1SG.DAT) on the one hand, and ꠘꠞꠞ ꠘayam ‘(to/for) him’ (transparently 3SG.M-DAT) on the other. Originally, all pronouns have been regular formations based on the respective unmarked pronominal element listed in the TOP column of Table 4.6 declined by adding a case suffix (see section 4.1.3). Use has caused many of these formations to contract and erode as grammaticalization progressed:

- (89) a. *ayang* → *yāꠞ*  
 ay-ang yāꠞ  
 1SG-A 1SG.A
- b. *iyatena* → *tan*  
 iy-a-t-ena tan  
 3SG-M-PL-GEN 3SG.M.GEN<sup>10</sup>

Table 4.6: Personal pronouns

Person	TOP	A	P	DAT	GEN	LOC	CAUS	INS
1SG	ay	yang	yas	yām	nā	yā	sā	rī
2SG	va	vāng	vās	vayam	vana	vaya	vasa	vari
3SG.M	ya	yāng	yās	yayam	yana	yāy	yasa	yari
3SG.F	ye	yeng	yes	yeyam	yena	yea	yesa	yeri
3SG.N	yo	yong	yos	yoyam	yonā	yoa	yosa	yori
3SG.INAN	ra	reng	rey	rayam	ran	raya	rasa	rari
1PL	ayn	nang	nas	nyam	nana	nyā	nisa	ni
2PL	va	vāng	vās	vayam	vana	vaya	vasa	vari
3PL.M	yan	tang	tas	cam	tan	ca	tis	ti
3PL.F	yen	teng	tes	teyam	ten	teya	tēs	teri
3PL.N	yon	tong	tos	toyam	ton	toya	tōs	tori
3PL.INAN	ran	teng	tey	racam	ten	raca	ratas	ray

The plural series used to be derived by adding  $\text{𐌆}$  *-n* or, in the third person,  $\text{𐌆}$  *-t-* to the pronoun stem, which can still be easily observed in the unmarked pronouns as well as in the alternation between  $\text{𐌆}$  *y-* and  $\text{𐌆}$  *t-* in the third person pronouns. The same goes for the gender-marking thematic vowel in the animate third person pronouns, which has been retained as a distinctive feature even in the non-core pronouns despite sometimes heavy modifications. A further interesting property of Ayeri is that synchronically, singular and plural are distinguished, except for the second person, where the forms are the same, basically like in English. Lehmann (2015) explains, however, that this is not an unusual route for languages to take:

New pronouns, especially for the second person singular, are often obtained by shifting pronouns around in the paradigm, especially by substituting marked forms for unmarked ones. This explains, for instance, the use of [...] English *you* for the second person singular (42)

The second person singular subject pronoun of English used to be *thou*, cognate to German *du*, which can still be found in Shakespeare, for instance. Something along the lines of English *you* as a second person plural pronoun replacing second person singular *thou* by way of a deferential singular use of a plural pronoun (OED 2016: *you*, pron., adj., and n.) may have happened in Ayeri as well.

<sup>10</sup> Strictly speaking, this could as well be glossed as  $t<a>n$  (3SG.GEN<M>). I chose to gloss the pronoun in the above way, however, in order to not overly complicate things.

The personal pronouns are used in just the same way as their full-NP counterparts would be, also in the non-core cases:

- (90) a. *Sa barya ang Paradan tandās kaleri.*  
 sa har-ya ang Paradan tanda-as kal-eri  
 AT beat-3SG.M A Paradan fly-P rag-INS  
 ‘Paradan beats the fly with a rag.’
- b. *Sa baryāng tandās kaleri.*  
 sa har=yāng tanda-as kal-eri  
 AT beat=3SG.M.A fly-P rag-INS  
 ‘He beats the fly with a rag.’
- c. *Sa barya ang Paradan yos kaleri.*  
 sa har-ya ang Paradan yos kal-eri  
 AT beat-3SG.M A Paradan 3SG.N.P rag-INS  
 ‘Paradan beats it with a rag.’
- d. *Sa barya ang Paradan tandās rari.*  
 sa har-ya ang Paradan tanda-as rari  
 AT beat-3SG.M A Paradan fly-P 3SG.INAN.INS  
 ‘Paradan beats the fly with it.’

In the above set of examples, (90a) shows a sentence with full NPs, with the agent, *ang Paradan* replaced by the third person singular masculine agent pronoun *yāng* in (90b); in (90c) the patient, *tandās*, is replaced with the third person singular neuter patient pronoun *yos*; in (90d), lastly, the instrument, *kaleri* is replaced with the third person singular inanimate instrumental pronoun *rari*. Furthermore, complex NPs are in complementary distribution with pronouns as anaphora to NPs, that is, an NP which contains an adjective is wholly replaced by an NP containing a personal pronoun:

- (91) a. *Ang ninye vehimley veno.*  
 ang nin=ye.Ø vehim-ley veno  
 A wear=3SG.F.TOP dress-P.INAN beautiful  
 ‘She wears a beautiful dress.’
- b. \**Ang ninye adaley veno.*  
 ang nin=ye.Ø ada-ley veno  
 A wear=3SG.F.TOP that-P.INAN beautiful  
 ‘\*She wears a beautiful it.’
- c. *Ang ninye adaley.*  
 ang nin=ye.Ø ada-ley  
 A wear=3SG.F.TOP that-P.INAN  
 ‘She wears it.’

Comparing the example sentences in (90) with the TOP column in Table 4.6 an important property of personal pronouns becomes apparent. That is, the ‘un-marked’ (or rather, zero-marked) pronoun forms are also the ones showing as verb agreement. An important difference in this respect, however, is that the third person singular inanimate verb agreement marker is not  $\text{ra}$ , but  $\text{ara}$ . The following two examples illustrate the parallel more clearly—observe the person marking on the verb in (92) and the corresponding object pronouns in (93):

- (92) a. *Sa manya ang Ajān Pila.*  
 sa man-ya ang Ajān Ø Pila  
 PT greet-3SG.M A Ajān TOP Pila  
 ‘Pila, Ajān greets her.’
- b. *Sa manye ang Pila Ajān.*  
 sa man-ye ang Pila Ø Ajān  
 PT greet-3SG.F A Pila TOP Ajān  
 ‘Ajān, she greets him.’
- (93) a. *Sa manye ang Pila ya.*  
 sa man-ye ang Pila ya.Ø  
 PT greet-3SG.F A Pila 3SG.M.TOP  
 ‘Pila greets him.’
- b. *Sa manya ang Ajān ye.*  
 sa man-ya ang Ajān ye.Ø  
 PT greet-3SG.M A Ajān 3SG.F.TOP  
 ‘Ajān greets her.’

Another important property of both pronouns and verbs is that agent pronouns (and patient pronouns under certain circumstances) replace person agreement by cliticizing to the verb stem. As person agreement morphology is a domain of verbs, it will be dealt with in more detail in the chapter on verbs proper. The following example illustrates the mainly relevant process, however:

- (94) a. *Sa manya ang Ajān Pila.*  
 sa man-ya ang Ajān Ø Pila  
 PT greet-3SG.M A Ajān TOP Pila  
 ‘Pila, Ajān greets her.’
- b. *Sa manyāng Pila.*  
 sa man=yāng Ø Pila  
 PT greet=3SG.M.A TOP Pila  
 ‘Pila, he greets her.’

Possessive pronouns are special compared to regular personal pronouns in that they act basically as possessive adjectives; pronominal uses of possessive pronouns need 𐌃: *da-* as a supporting particle. The main case for the pronouns listed above in the genitive column of Table 4.6 is that of possessive adjectives, which means that unlike personal pronouns, they are by themselves not in complementary distribution with nominal NPs, compare (91). Instead, they may be used as modifiers like, or alongside, adjectives, as (95) shows.

- (95) *nangaya ledō nā*  
       nanga-ya ledō nā  
       house-LOC blue ISG.GEN  
       ‘in my blue house’

Yet, however, possessives do not fully share the properties of adjectives, namely, they cannot be compared (\*𐌃𐌃𐌃𐌃 \**nā-eng* ‘\*myer’, \*𐌃𐌃𐌃𐌃 \**nā-vā* ‘\*myest’). Fronting them in actual pronominal fashion is possible, for instance, in predicative statements like the one in (96a). Alternatively, a phrasal construction with 𐌃𐌃𐌃𐌃: *vilyang-* ‘belong’ as indicated in (96b) may be used.

- (96) a. *Ada-nangāng da-nā.*  
       ada=nanga-ang da-nā  
       that=house-A one=ISG.GEN  
       ‘That house is mine.’  
       b. *Ang vilyangyo ada-nanga yas.*  
       ang vilyang-yo ada=nanga-Ø yas  
       AT belong-3SG.N that=house-TOP ISG.P  
       ‘That house belongs to me.’

#### 4.2.2 Demonstrative pronouns

Demonstrative pronouns in Ayeri are formed with the demonstrative prefixes: 𐌃𐌃: *eda-* ‘this’ (proximal), 𐌃𐌃: *ada-* ‘that’ (distal), and 𐌃: *da-* ‘such’ (indefinite). These are combined with a morpheme 𐌃𐌃 *nya*, which is related to the word for ‘person’, 𐌃𐌃𐌃 *nyān*. Table 4.7 gives the declined forms for all of them. Those forms attested in the corpus gathered from dictionary entries and example texts also used for the syllable structure analyses in section 1.2 appear in upright type, those that should be grammatical as well otherwise are given in italic type. The corpus is very small, but the prevalence of some forms is possibly reflecting varying degrees of grammaticalization at least to some extent. Table 4.8 gives the token frequencies of the various attested forms.

Table 4.7: Demonstrative pronouns

Case	Proximal	Distal	Indefinite
TOP	edanya	adanya	danya
A	edanyāng	adanyāng	<i>danyāng</i>
A.INAN	edareng, <i>edanyareng</i>	adareng, adanyareng	<i>danyareng</i>
P	edanyās	adanyās	danyās
P.INAN	edaley	<i>adaley</i>	danyaley
DAT	<i>edayam</i>	adayam	<i>danyayam</i>
GEN	edanyana	adanyana	danyana
LOC	<i>edanyaya</i>	adanyaya	<i>danyaya</i>
CAUS	<i>edanyasa</i>	<i>adanyasa</i>	<i>danyasa</i>
INS	<i>edanyari</i>	<i>adanyari</i>	<i>danyari</i>

Of all the cases, the agent demonstratives have the highest token frequency at a combined 52.53%, especially the distal pronouns are very frequent in the sample. Moreover, the distal inanimate agent demonstrative occurs twice as often as its animate counterpart, the shortened form ᐃᐃᐃᐃ *adareng* ‘that (one)’ being far more current than the full form ᐃᐃᐃᐃᐃᐃ *adanyareng*. Interestingly, the shortened form ᐃᐃᐃᐃ *edareng* ‘this one’ is also the only one attested for the inanimate proximate agent; similarly, the only dative demonstrative attested once is shortened as well: ᐃᐃᐃᐃ *adayam* ‘(to/for) that’. For non-core cases, only ‘long’ demonstratives are attested, albeit sparingly so.

Regarding the variation between ‘long’ and ‘short’ forms, it is not surprising that those demonstratives with a high frequency of use are eroded in some way: it seems that Ayeri prefers them to stay trisyllabic, which is achieved by dropping the ᐃᐃ *nya* part.<sup>11</sup> A further reason for dropping the ᐃᐃ *nya* part especially in the inanimate demonstratives may be that it is perceived as a marker of animacy—it has been noted above already that it is related to the word ᐃᐃᐃᐃ *nyān* ‘person’. Both factors, high frequency and semantic mismatch, may thus promote contraction.

Still, the question for the reason for the high frequency especially of ᐃᐃᐃᐃ *adareng* remains open. It may be explained by looking at a few typical examples of this word in context, however.

<sup>11</sup> According to the so-called Zipf’s law, word length and token frequency correlate in that the most frequently used words in a language also tend to be the shortest (Zipf 1935: 25–27).

 that-A.INAN such-P.INAN snake-GEN boa closed  
 ‘The one of the closed boa snake.’<sup>12</sup> (22)

In all of the example sentences in (97), *adareng* ‘that (one)’ serves as a dummy pronoun together with a predicative adjective or NP, which is the main reason why it occurs so frequently. This is to say, Ayeri prefers the demonstrative pronoun *adareng* as the dummy agent in predicative contexts over the personal pronoun *reng* ‘it’. Otherwise, however, demonstrative pronouns work regularly as deictic anaphora: ‘this’, ‘that’, and ‘such (a)’, except that as nominal elements they are declined for case—but not for number or animacy, which is a notable difference between demonstrative pronouns and personal pronouns:

- (98) a. *Ang vehya Ajān nangās.*  
 ang veh-ya Ø Ajān nanga-as  
 AT build-3SG.M TOP Ajān house-P  
 ‘Ajān builds a house.’
- b. *Nangās? Sa vehyāng may danya.*  
 nanga-as sa veh=yāng may danya-Ø  
 house-P PT build=3SG.M.A AFF such-TOP  
 ‘A house? He builds one indeed.’
- (99) a. *Sā hasuyeng eda-migorayye.*

 CAUT sneeze=3SG.F.A this=flower-PL-TOP  
 ‘These flowers make her sneeze.’
- b. *Ang tipinyon nivaye yena adanyari naynay.*  
 ang tipin-yon niva-ye-Ø yena adanya-ri naynay  
 AT itch-3PL.N eye-PL-TOP 3SG.F.GEN that-CAUS as.well  
 ‘Her eyes are itching due to that/them/those [the flowers] as well.’

As mentioned in the previous chapter (p. 67), the prefix *da-* ‘such, so’ can combine with a range of syntactic phrase types, but most notably NPs, to serve as an indefinite demonstrative:

- (100) *Adareng da-dipakanas.*  
 adareng da=dipakan-as  
 that-A.INAN such=pity-P  
 ‘That is such a pity.’

*da-* can be used to express English ‘one’ in the sense of a deictic anaphora as well. Thus, to express ‘the X one’, if X is an adjective, it is necessary to use the full

<sup>12</sup> More literal translations of this sentence are ‘That is the one of the closed boa snake’ or ‘That is one of a closed boa snake’.

demonstrative pronoun, 𐌆𐌔𐌰 *danya*, since adjectives do not decline, and Ayeri largely avoids undeclined NPs:<sup>13</sup>

- (101) a. *Silvyo ku-mino-ing danyāng kivo.*  
 silv-yo ku=mino=ing danya-ang kivo  
 look-3SG.N like=happy=so such-A little  
 ‘The little one looks so happy.’
- b. *Sa noyang danya tuvo.*  
 sa no=yang danya-Ø tuvo  
 PT want=1SG.A such-TOP red  
 ‘I want the red one.’

In language less formal than in (101b), it is also possible to abbreviate 𐌆𐌔𐌰 *danya* to the prefixed form 𐌆𐌰 *da-*, which may be complemented by adjectives and possessive pronouns alike. The adjective or pronoun basically forms a complex anaphora, then, which in most circumstances can be marked for case and topic like any other nominal element, as demonstrated in (102).

- (102) *Sa noyang da-tuvo.*  
 sa no=yang da=tuvo.Ø  
 PT want=1SG.A such=red.TOP  
 ‘I want the red one.’

If incorporated in this way, the adjective cannot take comparison morphology: (103a) is not possible since inflections cannot be appended to clitics (if we analyze 𐌆𐌰 *-eng* and 𐌆𐌰 *-vā* as such in this context); and the meaning of (103b) differs from what was intended, since the 𐌆𐌰 *-vā* clitic is appended not to the adjective but to the composite nominal as such.

- (103) a. \**da-tuvo-vāley*  
 da=tuvo=vā-ley  
 one=red=SUPL-P.INAN  
 Intended: ‘the reddest one’
- b. *!da-tuvoley-vā*  
 da=tuvo-ley=vā  
 one=red-P.INAN=most/\*SUPL  
 ‘most red ones’  
 Intended: ‘the reddest one’

<sup>13</sup> See section 4.1.3 above for examples of situations where nouns regularly do not exhibit case marking.

Table 4.9: Interrogative pronouns

Pronoun	Literal meaning	Idiomatic meaning
ṣṣṣ <i>sinya</i>	which one (ṣṣṣ <i>nyān</i> ‘person’)	‘who’, ‘what’, ‘which’
ṣṣṣ <i>sikan</i>	how much (ṣṣṣ <i>ikan</i> ‘much’)	‘how much’, ‘how many’
ṣṣṣ <i>sikay</i>	with what (ṣṣṣ <i>kayvo</i> ‘with’)	‘how’ (tool, circumstance)
ṣṣṣ <i>simin</i>	which way (ṣṣṣ <i>miran</i> ‘way’)	‘how’ (way, procedure)
ṣṣṣ <i>sitaday</i>	which time (ṣṣṣ <i>taday</i> ‘time’)	‘when’
ṣṣṣ <i>siyan</i>	which place (ṣṣṣ <i>yano</i> ‘place’)	‘where’

#### 4.2.3 Interrogative pronouns

The intererrogative pronouns are all formed with ṣṣ- *si-*, combined with a lexical element or a case marker; ṣṣ- *si-* is also related to the relativizer ṣṣ *si*. The interrogative pronouns are listed in Table 4.9.

A property which all interrogative pronouns share is that they are placed *in situ*. That is, they appear in the same position as the phrase they stand in for, so there will not be movement of the question word to the front as in English. Additionally, impersonal interrogative pronouns cannot be topicalized since they also do not inflect for case, which preempts the difference between zero-marked topicalized and overtly case-marked untropicalized forms.

- (104) a. *Sa petigavāṅg inun sikan?*  
 sa petiga=vāṅg inun-Ø sikan  
 PT catch=2SG.A fish-TOP how.much  
 ‘How much fish did you catch?’
- b. *Sa-sahavāṅg sitaday?*  
 sa~saha=vāṅg sitaday  
 ITER~COME=2SG.A when  
 ‘When will you return?’

In the table on interrogative pronouns above, ṣṣṣ *sinya* ‘who, what, which’ is separated from the other pronouns because it behaves differently. Namely, it can be declined for all cases according to the syntactic or semantic role of the NP it replaces, and it can also be topicalized, since the element asked about is likely high in discourse salience.

Table 4.10: Declension paradigm for ṣṣṣṣ *sinya* ‘who, what’

Case	Pronoun	Translation
TOP	ṣṣṣṣ <i>sinya</i>	‘who’, ‘what’
A	ṣṣṣṣṣṣ <i>sinyāng</i>	‘who’, ‘what’
A.INAN	ṣṣṣṣṣṣ <i>sinyareng</i>	‘who’, ‘what’
P	ṣṣṣṣṣ <i>sinyās</i>	‘whom’, ‘what’
P.INAN	ṣṣṣṣṣṣ <i>sinyaley</i>	‘whom’, ‘what’
DAT	ṣṣṣṣṣṣ <i>sinyayam</i>	‘for/to whom’, ‘for/to what’
GEN	ṣṣṣṣ <i>sinyana</i>	‘whose’, ‘from whom’, ‘from what’
LOC	ṣṣṣṣ <i>sinyaya</i>	‘in/at/on whom’, ‘in/at/on what’
CAUS	ṣṣṣṣṣ <i>sinyisa</i>	‘due to/because of whom’, ‘due to/because of what’
INS	ṣṣṣṣṣ <i>sinyari</i>	‘by whose help’, ‘with what’

- (105) a. *Ang yomayo sinya adaya?*<sup>15</sup>  
ang yoma-yo sinya-Ø adaya  
AT exist-3SG.N who-TOP there  
‘Who is there?’
- b. *Sa narayeng sinyā?*  
sa nara=yeng sinyā-Ø  
PT say=3SG.F.A what-TOP  
‘What did she say?’

Ayeri does not strictly distinguish animate and inanimate entities in its interrogative pronouns, so there is no distinction between ‘who’ and ‘what’. ṣṣṣṣ *sinya* and/or the verb will simply inflect according to context and to the speaker’s expectations or knowledge (compare Table 4.10). Thus, there is also no dedicated question word for ‘why’, since in Ayeri one can simply ask ‘due to what/whom’ by inflecting ṣṣṣṣ *sinya*; ṣṣṣṣṣ *sinyisa* is essentially ṣṣṣṣ *sinya* marked for causative case by the suffix ṣṣṣṣ *-isa*.

- (106) a. *Le kayāng adanya sinyayam?*  
le ka=yāng adanya-Ø sinyā-yam  
PT.INAN throw.away=3SG.M.A that-TOP what-DAT  
‘Why (= what for) did he throw that away?’

<sup>15</sup> This may be shortened to just ṣṣṣṣṣṣ *sinyāng adaya?* ‘who (is) there?’ (who-A there).

- b. *Ang prantoyva sinyisa?*  
 ang prant-oy=va.Ø siny-a-isa  
 AT ask-NEG=2SG.TOP what-CAUS  
 ‘Why (= because of what) did you not ask?’

While there is no dedicated ‘why’, Ayeri distinguishes between two kinds of ‘how’:  $\text{ḥ}^{\text{h}}\text{ḥ}^{\text{h}}\text{ḥ}^{\text{h}}$  *simin* asks about the way by which—or the circumstances under which—an action is carried out, whereas  $\text{ḥ}^{\text{h}}\text{ḥ}^{\text{h}}\text{ḥ}^{\text{h}}$  *sikay* asks for the means or tools used to carry out an action:

- (107) a. *Le tiyavāng vadisān simin?*  
 le tiya=vāng vadisān-Ø simin  
 PT.INAN make=2SG.A bread-TOP how  
 ‘How do you make bread?’  
 b. *Le peralvāng sagan sikay?*  
 le peral=vāng sagan-Ø sikay  
 PT.INAN grind=2SG.A flour-TOP how  
 ‘How do you grind flour?’

The correct answer to the question in (107a) needs to treat the process of making bread, since  $\text{ḥ}^{\text{h}}\text{ḥ}^{\text{h}}\text{ḥ}^{\text{h}}$  *simin* asks about the way; a correct answer to the question in (107b), on the other hand, will likely mention grinding utensils, like a mill or a pestle.

Comparing Tables 4.9 and 4.10, it may strike the reader’s eye that there are two possibilities to express ‘where’—lexical  $\text{ḥ}^{\text{h}}\text{ḥ}^{\text{h}}\text{ḥ}^{\text{h}}$  *siyan* and synthetic  $\text{ḥ}^{\text{h}}\text{ḥ}^{\text{h}}\text{ḥ}^{\text{h}}$  *sinyaya*. It is important to note, however, that these are not strictly interchangeable, even though some variation is to be expected. While  $\text{ḥ}^{\text{h}}\text{ḥ}^{\text{h}}\text{ḥ}^{\text{h}}$  *siyan* refers to *places* in general, the  $\text{ḥ}^{\text{h}}\text{ḥ}^{\text{h}}\text{ḥ}^{\text{h}}$  *sinya* series refers to *entities* both animate and inanimate more specifically:

- (108) a. *Saravāng siyan? — Ya Sikatay.*  
 sara=vāng siyan — Ya Sikatay  
 go=2SG.A where — LOC Sikatay  
 ‘“Where are you going?”—“To Sikatay.”’  
 b. *Ya divvāng sinyā? — Ya Haki.*  
 ya div=vāng sinyā-Ø — Ya Haki  
 LOCT stay=2SG.A who-TOP — LOC Haki  
 ‘“With whom are you staying?”—“At Haki’s”’

#### 4.2.4 Indefinite pronouns

Haspelmath (1997: 56) notes how descriptions of languages often do not document indefinite pronouns—whether they simply do not exist in this language or whether

Figure 4.1: The implicational map for indefinite pronoun functions (Haspelmath 1997: 4)

they escaped the author's attention remains unknown in these cases. It may thus be duly noted here that Ayeri does indeed possess indefinite pronouns.<sup>16</sup> In order to classify languages, Haspelmath (1997) generalizes the map displayed in Figure 4.1 based on a sample of 100 languages from all continents, although he notes that this sample has a European bias due to the availability of data (2). Languages typically form contiguous areas on the map, even though they may carve it up quite differently, and with overlaps between the different semantic groupings 1–9.

An interesting question that Haspelmath (1997) poses towards the end of his book is whether there are any correlations between word order typology and the preference for generic nouns ('person', 'thing', 'place', 'time', 'manner') or, for instance, interrogative-based systems (239–241). While from Haspelmath (1997)'s concluding statistics it looks as though there is a slight preference of languages with which Ayeri shares basic typological traits—such as verb-initial, verb-object, and noun-genitive word order, also having prepositions—for basing indefinite pronouns on generic nouns, Haspelmath (1997) concedes that these seeming correlations are skewed by areal effects, "because indefinite pronouns have a strongly areal distribution" (241).<sup>17</sup> He still presumes, however, that word-order typology may have an effect on the formation of indefinites insofar as it correlates with grammaticalization more generally (239).

<sup>16</sup> As it is a fictional language, the value of this assertion to linguistic typology remains doubtful, however.

<sup>17</sup> The map in *WALS*, Haspelmath (2013), suggests areal clusters at least for generic-noun based systems in Africa and Southeast Asia. *WALS* classifies 194 out of 326 languages (60%) as possessing interrogative-based indefinite pronouns to date, with evidence for this type quoted for all continents except Africa. The next smaller group, generic-noun based, falls behind at 85 data points (26%). The curious lack of evidence for the interrogative type in Africa despite its being the most frequent one in the set on all other continents may be due to the unavailability of data. Crossreferencing the *WALS* data for constituent-order with the map on indefinite-pronoun systems did not yield a result which obviously suggested a correlation.

Table 4.11: Indefinite pronouns

	every	some	none
PERSON	enya	arilinya	ranya
THING	enya	arilinya, arilya	ranya
PLACE	yanen	yāril	yanoy
TIME	tadayen	tajaril; metay	tadoy; jānyam
MANNER	arēn	miranaril	are moy
REASON	—	yāril	—

Haspelmath (1997) mentions generic nouns, and these can be combined with the quantifying expressions ‘every’, ‘any’, ‘some’, and ‘none’ into an array like the one presented in Table 4.11. Ayeri does not distinguish ‘every’ from ‘any’ as English does; there is also no distinction in polarity (affirmative versus negative) the way English has it:

- (109) a. \*I don’t know something about this.  
b. I don’t know anything about this.

Likewise, Ayeri does not distinguish between animate and inanimate indefinite referents—the same pronouns are used for either, although the shortening of *arilinya*, *arilya*, can only be used for inanimates, similar to the distinction in the demonstrative pronouns between *adanyāng* ‘that one’ (that.one-A) and *adareng* ‘that one’ (that.one-A.INAN; see section 4.2.2). Two further features stand out, however.

Firstly, most of the pronouns in the chart have a lexical part—Ayeri’s indefinite pronouns are based on generic nouns. Thus, the pronouns referring to people and things all have the *-nya* element in common, which we also find in the interrogative and demonstrative pronouns, and which also appears in the word *nyān* ‘person’. In the same way, the pronouns related to the notion of place have a *ya-* or *yan-* part, which we also find in *yano* ‘place’.<sup>18</sup> In a regular continuation of this pattern, the indefinite pronouns of time all have an element related to *taday* ‘time’ in common, which is obscured somewhat by palatalization in *tajaril*. The exception to this series, then, is *jānyam*, which is the multiplicative numeral formed from *ja* ‘zero’, thus means ‘zero times’ or ‘not once’ rather than

<sup>18</sup> *yano* itself is an old nominalization and very likely related as a morpheme to the locative suffix *-ya*.

‘never’, although it can also be used emphatically for the latter. The series of manner pronouns is an absolute exception in that it must be a residue from an older layer of grammaticalization since *are-* is not a recognizable morpheme in the modern language.<sup>19</sup> *miranaril* is a regular formation of *miran* ‘way, manner’ combined with the quantifier (!) for indefinite amounts, *-aril* ‘some’.

This observation leads to the second regular feature, that is, affixes as modifiers to generic nouns. The ‘every’ series regularly features the morpheme *en*, either prefixed or suffixed, which is related to the quantifier *-ben* ‘every, all, each’ and can presumably be found even on *arēn* in spite of its obscure lexical base. In the same manner, the series related to inspecific generic-noun referents is marked by the affix *aril* which, as we have just seen above, is otherwise used to refer to inspecific quantities, for instance, *vadisān-aril* ‘some bread’ (bread=some). In the case of *miranaril*, the suffix seems somewhat of an odd choice, since manner is not a quantifiable variable in the same way people, things, locations or moments are. Possibly, it is chosen rather in analogy with the other pronouns in this series than on semantic grounds. In any event, *metay* has the semantically more ‘proper’ *me-* prefix, relating it to absolute inspecificity.<sup>20</sup> This alternation is employed to distinguish between the meaning of ‘sometime’, that is, occurring once an unspecified point in time, and *tajaril* ‘sometimes’, which refers to repeated occurrence at inspecific times. The alternation between *miranaril* and regularly derived *mə-miran* can be leveraged to express a specificity difference as well. While the former suggests that an action is carried out or an event is happening by means of a specific, though unknown procedure, the latter suggests just any possible procedure. Lastly, the negative series is regularly marked by the negative suffix *-oy*, which also occurs with adjectives and verbs (see sections 4.3.2 and 4.5.4). An outlier in this series is the person/thing-related indefinite pronoun, *ranya*. The etymologic connections of the *ra* part are not presently known, perhaps the postposition *ran* ‘against’ is related.

The chart in Table 4.11 only tells half the truth by not giving any information on use contexts for the individual forms, so how do they fit in with the chart from Haspelmath (1997) quoted at the beginning of this section? Regarding the functions of indefinite pronouns annotated to the numbers on the map, Haspelmath (1997) gives the following examples, which, however, mostly only give one example for either the ‘person’ or ‘thing’ category at a time. It is up to the reader to generalize from this (2–3):<sup>21</sup>

<sup>19</sup> I probably made this up as I was going, many years ago, and without considering systematic implications, as I was unaware of them at the time.

<sup>20</sup> Compare German *irgendjemand* and French *n’importe qui* ‘no matter who’.

<sup>21</sup> These appear here reordered according to numerical order. The book lists them according to their logical order as tracing the map, the enumeration somewhat confusingly tied in with the

Figure 4.2: Map of indefinite pronoun functions in Ayeri

- (110)
1. specific, known to the speaker:  
*Somebody called while you were away: guess who!*
  2. specific, unknown to the speaker:  
*I heard something, but I couldn't tell what kind of sound it was.*
  3. non-specific, irrealis:  
*Please try somewhere else.*
  4. polar question:  
*Did anybody tell you anything about it?*
  5. conditional protasis:  
*If you see anything, tell me immediately.*
  6. indirect negation:  
*I don't think that anybody knows the answer.*
  7. direct negation:  
*Nobody knows the answer.*
  8. standard of comparison:  
*In Freiburg the weather is nicer than anywhere in Germany.*
  9. free choice:  
*Anybody can solve this simple problem.*

As we have seen in Table 4.11 above, Ayeri does not make a difference between 'every' and 'any', which is why the 'some' series can be applied to all of (1)–(5); it can also be used for indirect negation (6). The pronouns from the 'none' column, then, are used to express direct negation (7). Since double negation—that is, agreement in negation between verbs and indefinite pronouns for purposes of emphasis rather than double negation in the strictly logical sense—is possible, the 'none' series may also be employed for indirect negation (6). Moreover, Ayeri uses the 'every' series

running enumeration of examples.

for both standard of comparison (8) and free choice (9). Besides this, absolute-indefinite 𐄢 *me-* can be used for (3)–(6) in combination with a (generic) noun to attach to. It needs to be noted that only the indefinite pronouns with person or thing reference (those including 𐄢 *nya*) decline; they can also be topicalized. The other indefinites, relating to place, time and manner, are indeclinable and also cannot be topics for this reason. For the ‘specific’ categories (1) and (2) it is furthermore possible to use the plain generic nouns, 𐄢𐄢 *nyān* ‘person’, 𐄢𐄢𐄢 *linya* ‘thing’, 𐄢𐄢𐄢 *yano* ‘place’, 𐄢𐄢𐄢 *taday* ‘time’, 𐄢𐄢𐄢 *miran* ‘way’, however. Figure 4.2 shows the groupings for Ayeri; (III) gives examples of all types.

#### 4.2.5 Relative pronouns

As has been described before, Ayeri connects relative clauses to main clauses with the relativizer ꞑ *si*. This relativizer can be declined for case in accordance with the relative clause's head in the matrix clause. The respective forms can be gathered from Table 4.12 (column 'Pronoun').

- (112) a. *Eryyo tarela natrangās si tado.*  
 ery-yo tarela natranga-as si tado  
 use-3SG.N still temple-P REL old  
 'The temple, which is old, is still being used.'
- b. *Edanyāng ayonas sirtang sas ang sihabaya mondoas nana.*  
 edanya-ang ayon-as sirtang si-as ang sihaba=ya mondo-as nana  
 this-A man-P young REL-P ang tend=3SG.M.TOP garden-P IPL.GEN  
 'This is the young man who tends our garden.'

As explained in section 3.3, if the relativizer is immediately following its lexical head, only the base form ꞑ *si* is used, which is illustrated in (112a). Here, the head of the relative clause is *natrangās* 'the temple', which is immediately followed by the relative clause. If word material is intervening, however, which is the case in (112b), the relative pronoun may be inflected to agree in case with its antecedent in more formal language for referential clarity: *sas* agrees in case with *ayonas* two words over to the left. Relative pronouns do not agree in number with their heads, though, and in gender only insofar as it is relevant to nominal case inflection, that is, agents and patients are distinguished for animacy.

A special property of the relative pronoun is that it can be declined for its role in the relative clause as well to express more complex relationships between the main clause and the relative clause. The respective forms can be found in the columns titled 'pronoun with secondary inflection' in Table 4.12. The token frequency of the actually occurring complex relative pronouns in the very small corpus gathered from example texts and dictionary entries (see section 1.2) is given in Table 4.13.

Compared to the unmarked relativizer  $\text{ḥ} si$ , which occurs 50 times in the sample (all relative pronouns from Table 4.12 occur 80 times in total), the complex relative pronouns have a very low frequency. This is not surprising, since ‘for whom’, ‘by which’, etc. are quite specialized expressions. It also seems that those forms unmarked for their antecedent are preferred, since those are the only ones attested—the sample is really much too small to make actually meaningful judgements here, however. Examples of complex relative pronouns are:

- (113) a. *Le vacyang koya yana sileyya ang layāy adanyana.*  
 le vac=yang koya-Ø yana si-le-y-a ang laya=ay.Ø adanya-na  
 PT.INAN like=ISG.A book-TOP 3SG.M.GEN REL-P.INAN-LOC A read=ISG.TOP that-GEN  
 ‘I like his book in which I read about it.’
- b. *Ya saratang yano siyām sarasatang.*  
 ya sara=tang yano-Ø si-Ø-yām sara-asa=tang  
 LOCT go=3PL.M.A place-TOP REL-LOC-DAT go-HAB=3PL.M.A  
 ‘They went to the place to which they always went.’

It needs to be pointed out that a complex relative pronoun cannot form the topic of the relative clause even though it is marked for case according to the relative clause’s syntactic domain. Furthermore, the relative pronoun cannot receive inflection for an agent or a patient of the embedded clause. The following examples illustrate these points:

- (114) \**Mica edaya sobayāng si (‘sī) na ibayang koyaley.*  
 mit-ya edaya sobaya-ang si-Ø-Ø na iha=yang koya-ley  
 live-3SG.M here teacher-A REL-A-TOP GENT borrow=ISG.A book-P.INAN  
 ‘Here lives the teacher from whom I borrowed a book.’
- (115) \**Mica edaya sobayāng sāng le sobya payutān yām.*  
 mit-ya edaya sobaya-ang si-Ø-ang le sob-ya payutān-Ø yām  
 live-3SG.M here teacher-A REL-A-A PT.INAN teach-3SG.M math-TOP ISG.DAT  
 ‘Here lives the teacher who taught me math.’
- (116) \**Mica edaya sobayāng sās ya kradasayang kardang.*  
 mit-ya edaya sobaya-ang si-Ø-as ya krad-asa=yang kardang-Ø  
 live-3SG.M here teacher-A REL-A-P LOCT hate-HAB=ISG.A school-TOP  
 ‘Here lives the teacher whom I used to hate in school.’

Example (114) displays a sentence in which the relative pronoun, ungrammatically, forms the controller of topic agreement on the verb in the relative clause:  $\text{ḥ} na$  as a genitive topic is supposed to refer to  $\text{ḥ} sobayāng$  in the matrix clause by way of the relativizer  $\text{ḥ} si$  which would then necessarily carry a zero-morpheme

topic marker. There is no resumptive pronoun in the relative clause, so the relative pronoun itself forms the anaphora in the relative clause referring to the relativized argument of the matrix clause. This is not possible.

In example (115), the relative pronoun \*ṣāṅ carries no overt case agreement as it directly follows its antecedent (\*ṣāṅṅ otherwise) but the long vowel shows that it is declined as the agent of the relative clause; the verb agrees using *-ya* accordingly. There is no resumptive agent pronoun, so the relative pronoun would stand in for the agent NP that would be necessary if the relative clause were an independent sentence. The use of the relative pronoun as an agent-NP replacement in this sentence is equally ungrammatical, though, and so is the agreement between verb and declined relative pronoun.

Similarly, in (116), the relative pronoun carries case marking for the patient of the relative clause, since the agent of the matrix clause serves as the patient NP of the embedded clause. This is not grammatical either.

Altogether, it seems that in Ayeri, core arguments of intransitive and transitive clauses—agents and patients—cannot precede the embedded verb of a relative clause; the verb firmly forms the head of the embedded clause in this regard. The relative pronoun also cannot receive secondary marking for agents or patients, and neither can it stand in directly as the agent and patient NP of the relative clause, respectively. It is interesting in this regard that Ayeri *does* allow this for recipients, however, maybe since by their nature as goals they carry something of a locative connotation (compare (113b)) and are thus less tightly integrated with verbs, occupying a middle ground between core arguments and adverbials like the locative proper.<sup>22</sup>

#### 4.2.6 Reflexives and reciprocals

As mentioned previously, Ayeri forms its reflexives with the prefix *ṣitang-* in combination with a personal pronoun, compare (117). If the agent of the action is the same as the reflexive patient—that is, the agent acts on itself—the reflexive prefix can also migrate onto the verb instead, which is demonstrated in (118).

- (117) *Ang silvye                    sitang=yes    puluyya.*  
          ang silv=yes.Ø        sitang=yes    puluy-ya  
          AT    see=3SG.F.TOP   self=3SG.F.P   mirror-LOC

‘She sees herself in the mirror.’

<sup>22</sup> This would be interesting to explore in terms of grammaticalization, as it is very possible that this behavior reflects a stage of the language before *-yam* had been grammaticalized as the dative marker. In this respect, it would as well be necessary to explore whether the similarity between the dative marker *-yam* and the locative marker *-ya* is indeed etymological or merely incidental.

- (118) *Ang sitang-silvye puluyya.*  
 ang sitang=silv=ye.Ø puluy-ya  
 AT self=see=3SG.F.TOP mirror-LOC  
 ‘She sees herself in the mirror.’

Doing the same with a non-patient pronoun does not work, however, so the sentence in (118) with the reflexive *ṣṭang*: *sitang* marked on the verb is not equivalent to the following one, in which *ṣṭang*: *sitang*- appears together with a personal pronoun in the locative case, even though here as well, the agent and the locative pronoun refer to the same entity:

- (119) *Ang silvye sitang-yea puluyya.*  
 ang silv=ye.Ø sitang=yea puluy-ya  
 AT look=3SG.F.TOP self=3SG.F.LOC mirror-LOC  
 ‘She looks at herself in the mirror.’

It may be noted furthermore that the genitive/possessive pronoun series conveys the meaning of ‘one’s own’, which is completely regular in meaning (‘of X-self’), however:

- (120) *Le no eryongyang pakay sitang-nā.*  
 le no ery-ong=yang pakay-Ø sitang=nā  
 PT.INAN want use-IRR=1SG.A umbrella-TOP self=1SG.GEN  
 ‘I’d like to use my own umbrella.’

*ṣṭang* *sitang* is also used to carry quantifiers pertaining to a pronominal suffix (121a), since appending a quantifier directly to the conjugated verb stem itself can be ambiguous (121b).

- (121) a. *Ang koronay sitang-nyama guratanley.*  
 ang koron=ay.Ø sitang=nyama guratan-ley  
 AT know=1SG.TOP self=even answer-P.INAN  
 ‘Even I know the answer.’  
 b. *!Ang koronay-nyama guratanley.*  
 ang koron=ay.Ø=nyama guratan-ley  
 AT know=1SG.TOP=even answer-P.INAN  
 ‘I even know the answer.’  
*Intended:* ‘Even I know the answer.’

It appears as though *ṣṭang* *sitang* does not act as the controller of the verbal topic marker; this is illustrated by the fact that *ṣṭang* *sitang* and a non-topic agent pronominal suffix can appear side by side. As described previously (section 3.2.5, p. 89), lexical NPs and pronominal suffixes on the verb are mutually exclusive.

- ‘The answer, even I know it.’

- ‘Only he is running quickly enough.’

- 'Ajān and Pila talk to each other.'

- ‘They can hear each other.’

Adjectives are one of the parts of speech in Ayeri which do not inflect for any of the grammatical properties of their heads, that is, there is no agreement relation between adjectives and nominal heads. They do inflect for comparison under certain circumstances, however, and can also take various affixes that modify the meaning of the adjective stem.

### 4.3.1 Comparison

In cases where a comparee is left unexpressed or the patient forms the standard of comparison, Ayeri uses clitic suffixes on adjectives. The suffixes involved are  $\text{ṣṣ}$  -eng (COMP) and  $\text{ṣṣ}$  -vā (SUPL):

- (125) a. *Yeng ganyena men si alingo-eng.*  
 yeng gan-ye-na men si alingo=eng  
 3SG.F.A child-PL-GEN one REL clever=COMP  
 ‘She is one of the more clever children.’
- b. *Ang tavya Diyan tingracas ban-eng na Maha.*  
 ang tav-ya Ø Diyan tingrati-as ban=eng na Maha  
 AT become-3SG.M TOP Diyan musician-P good=COMP GEN Maha  
 ‘Diyan became a better musician than Maha.’
- c. *Naratang, yāng pokamayās para-vā.*  
 nara=tang yāng pokamaya-as para-vā  
 say=3PL.M.A 3SG.M.A shooter-P fast-SUPL  
 ‘They said he is the fastest shooter.’

In (125a) the comparee is missing, while in (125b), the quality under comparison,  $\text{ṣṣ}$  *tingracas ban-eng* ‘a better musician’, is a patient NP; the standard,  $\text{ṣṣ}$  *Maha*, is expressed by an adverbial genitive NP. The example in (125c) similarly expresses an absolute without giving a group of entities to draw from. In all these cases, it is, however, also possible to use a more complex analytic construction using verbs.

### 4.3.2 Negation

Adjectives in Ayeri can be negated in two ways: categorially with  $\text{ṣṣ}$  -arya, and pragmatically with  $\text{ṣṣ}$  -oy. These correspond to English *un-*, and *in-*, *il-*, *ir-* etc. for categorial negation, and to *not* for pragmatic negation.  $\text{ṣṣ}$  -oy absorbs the vowel of the root it is attached to if said root ends in a vowel.

- (126) *Telbaya miseryanang ku-ardārya.*  
 telba-ya miseryan-ang ku=arda-arya  
 show-3SG.M method-A like=suitable-NEG  
 ‘The method proved unsuitable.’
- (127) *Pakoy eda-yanoreng.*  
 paka-oy eda=yano-reng  
 safe-NEG this=place-A.INAN  
 ‘This place is not safe.’

Example (126) displays an adjective which carries the categorial negation marker ၼ် -*arya*; the adjective in (127) carries the simple, pragmatic negation marker ၼ် -*oy*. Which one to use is up to the speaker, since both negate the described property. The categorial marker puts an emphasis more on expressing a general opposite, while the pragmatic marker simply negates, so that it is not necessarily implied that the negative state persists. The place that is ကုန် *pakoy* ‘not safe’ now is not necessarily ကုန် *pakārya* ‘unsafe’ in general, but simply not safe in the context of the here and now of the utterance.

Besides *ad hoc* derivation of categorial negatives with ၼ် -*arya*, there are also a few lexicalized instances. These have an idiomatic meaning and the negator or the word itself may be irregularly reduced. Examples are, among others:

- (128) a. ခု *ban* ‘good’ → ခု *banaya* ‘ill, sick’  
 b. ကွန် *kovaro* ‘easy’ → ကွန် *kovarya* ‘awkward’  
 c. ခိမ် *sirimang* ‘straight’ → ခိမ် *sirimaya* ‘passive’

#### 4.3.3 Adjectivization

Adjectives in Ayeri are very commonly zero derivations, that is, there is rather free conversion between nouns and adjectives,<sup>23</sup> for instance:

- (129) a. ၼ် *Ayeri* ‘Ayeri’ ~ ၼ် *Ayeri* ‘Ayeri’  
 b. ပု *disa* ‘soap, lye’ ~ ပု *disa* ‘soapy, alkaline’  
 c. ခု *gino* ‘drink’ ~ ခု *gino* ‘drunk’  
 d. ကု *pahamay* ‘danger’ ~ ကု *pahamay* ‘dangerous’  
 e. ခု *sempay* ‘peace’ ~ ခု *sempay* ‘peaceful’

Adjectives can also be derived from verbs with the causative suffix ၼ် -*isa*, which often corresponds to adjectives derived from the past participle form—the meaning is often, but not necessarily, relating to an achieved state. The suffix may change the last vowel to ခိ *u* or drop it; a specific pattern to these changes is not recognizable. The derivations may be idiomatic occasionally, as some derivations in the example below show.

- (130) a. ကု *kelang-* ‘connect’ → ကု *kelangisu* ‘connected, related’  
 b. ကု *palung-* ‘distinguish’ → ကု *palungisa* ‘various’  
 c. ခု *sundala-* ‘lose’ → ခု *sundalisu* ‘lost’  
 d. ခု *taban-* ‘write’ → ခု *tahanis* ‘literary’  
 e. ခု *vesa-* ‘give birth’ → ခု *vesisa* ‘native’

<sup>23</sup> Adjectives and split-off modifiers in noun–noun (compare section 4.1.5) compounds are thus similar at least superficially.

There are also at least two words where an *-isa* adjective is derived not from a verb, but a word of a different part of speech—in this case, a noun, and another adjective:

- (131) a. *ṣṣin* 'luck' → *ṣṣinisa* 'lucky'  
 b. *iray* 'high' → *irayisu* 'exalting'

#### 4.3.4 Other affixes

As with nouns, other affixes which can be attached to adjectives as clitic hosts, are the prefix *ku-*, expressing semblance, as well as quantifying and grading suffixes, of which the suffixes used to express comparative and superlative are, essentially, a grammaticalized variety, since *-eng* can also be used like 'rather'.

- (132) *Ku-pikisu paray-parayang.*  
*ku=pikisu paray~paray-ang*  
*like=scared DIM~cat-A*  
 'The kitten is like scared.'

- (133) *Napay-eng eda-prikanreng.*  
*napay=eng eda=prikan-reng*  
*spicy=rather this=soup-A.INAN*  
 'This soup is rather spicy.'

## 4.4 Adpositions

Adpositions are another part of speech in Ayeri whose stem itself does not inflect. Ayeri's most basic adpositions are derived from relational nouns, which is likely the reason why Ayeri mostly employs prepositions, with postpositions and ambipositions being less important placement patterns (Hagège 2010: 110–111; Lehmann 2015: 81 ff.). Adpositions in their most basic use trigger locative marking on the governed NP, the prepositional object; for allative and ablative meanings, the prepositional object may also appear in the dative and the genitive case, respectively, as described in section 4.1.3.<sup>24</sup> The cognitive metaphor 'time equals space' with the future conceptualized as lying ahead and the past behind also holds in Ayeri, so that some of the words describing locations also double to describe temporal relations.

Table 4.14: Prepositions (simple)

	Preposition	Etymology (or related to)
ᐱᐱᐱᐱ	<i>agonan</i>	outside
ᐱᐱᐱ	<i>avan</i>	bottom, ground
ᐱᐱᐱᐱ	<i>eyran</i>	under, below
ᐱᐱᐱᐱᐱ	<i>eyrarya</i>	over
ᐱᐱᐱ	<i>kayvo</i>	with, beside <sup>25</sup>
ᐱᐱᐱ	<i>kong</i>	inside, within
ᐱᐱᐱ	<i>ling</i>	on
ᐱᐱᐱ	<i>luga</i>	among, between
ᐱᐱᐱᐱᐱ	<i>mangasaba</i>	towards, in + <i>time</i>
ᐱᐱᐱᐱᐱ	<i>mangasara</i>	away
ᐱᐱᐱᐱ	<i>marin</i>	front, on (walls etc.)

ᐱᐱᐱᐱᐱ	<i>eyran</i>	ᐱᐱᐱᐱᐱ <i>eyran</i> ‘sole’
ᐱᐱᐱᐱᐱ	<i>eyrarya</i>	ᐱᐱᐱᐱᐱ <i>eyran</i> ‘sole’ + ᐱᐱᐱᐱ <i>-arya</i> (NEG)
ᐱᐱᐱᐱ	<i>kayvo</i>	ᐱᐱᐱᐱᐱ <i>kayv-</i> ‘accompany’
ᐱᐱᐱᐱ	<i>kong</i>	ᐱᐱᐱᐱᐱ <i>kong</i> ‘inside’
ᐱᐱᐱᐱ	<i>ling</i>	ᐱᐱᐱᐱᐱ <i>ling</i> ‘top’
ᐱᐱᐱᐱ	<i>luga</i>	ᐱᐱᐱᐱᐱ <i>luga-</i> ‘pass, penetrate’
ᐱᐱᐱᐱᐱᐱ	<i>mangasaba</i>	ᐱᐱᐱᐱᐱᐱ <i>manga saba-</i> ‘coming’
ᐱᐱᐱᐱᐱᐱ	<i>mangasara</i>	ᐱᐱᐱᐱᐱᐱ <i>manga sara-</i> ‘going’
ᐱᐱᐱᐱᐱᐱ	<i>marin</i>	ᐱᐱᐱᐱᐱᐱ <i>marin</i> ‘face, surface’
ᐱᐱᐱᐱᐱᐱ	<i>miday</i>	ᐱᐱᐱᐱᐱᐱ <i>miday-</i> ‘surround’
ᐱᐱᐱᐱᐱᐱ	<i>nasay</i>	ᐱᐱᐱᐱᐱᐱ <i>nasay</i> ‘proximity’
ᐱᐱᐱᐱᐱᐱ	<i>nuvo</i>	ᐱᐱᐱᐱᐱᐱ <i>nuho</i> ‘liver’
ᐱᐱᐱᐱᐱᐱ	<i>pang</i>	ᐱᐱᐱᐱᐱᐱ <i>pang</i> ‘back’
ᐱᐱᐱᐱᐱᐱᐱᐱ	<i>patameng</i>	ᐱᐱᐱᐱᐱᐱᐱ <i>patam</i> ‘heart’

## 4.4.1 Prepositions

Table 4.14 gives all the words in Ayeri which may be used as prepositions. As mentioned above, most of these are derived transparently from nouns, so they have probably been grammaticalized relatively recently—their non-preposition meaning is still transparent, they are still phonologically rather complex, and some of them are even polysyllabic in spite of not being composed and covering rather basic meanings.<sup>26</sup> Since these nouns have ceased to function as common nouns in this context

<sup>24</sup> Even a prolativ use together with the instrumental is thinkable.

<sup>25</sup> There is also a preposition ᐱᐱᐱᐱᐱ *dayrin* ‘side’ listed in the dictionary, however, this has never seen much use. Instead, ᐱᐱᐱᐱᐱ *kayvo* has come to cover ‘beside, to the side of’ as well.

<sup>26</sup> Unsurprisingly, Hagège (2010: 129) references Zipf regarding speech economy and token frequency. According to Lehmann (2015: 134–141), the phonological integrity of morphemic units reduces as grammaticalization is progressing (with token frequency increasing due to increasing obligatoriness). Bybee and Hopper (2001) see the reason for phonological reduction of highly frequent phonological material “in the automatization of neuro-motor sequences [...]. Such reductions are systematic across speakers; that is, they do not represent ‘sloppy’ or ‘lazy’ speech” (11). Hence, for example, English’s most basic prepositions are extremely short and

due to grammaticalization, however, it is not possible to inflect them in the way described in section 4.1. Thus, for example, while it is possible to say (134a), it is not really possible to say (134b):

- (134) a. *Le yomareng kanka lingya rivanena.*  
 le yoma=reng kanka-Ø ling-ya rivan-ena  
 PT.INAN exist=3SG.INAN.A snow-TOP top-LOC mountain-GEN  
 ‘There is snow on the top of the mountain.’<sup>27</sup>
- b. \**Ang nedraye lingya nedrānena.*  
 ang nedra=ye.Ø ling-ya nedrān-na  
 AT sit=3SG.F.TOP top-LOC chair-GEN  
 ‘<sup>2</sup>She sits on the top of a chair.’

Instead, the grammatical way to express (134b) is the following, using ሲገባ *ling* as a preposition with the object in the locative case:

- (135) *Ang nedraye ling nedrānya.*  
 ang nedra=ye.Ø ling nedrān-ya  
 AT sit=3SG.F.TOP top chair-LOC  
 ‘She sits on a chair.’

In this case, since *on* is the expected position of sitting with regards to chairs, the preposition can even be dropped:

- (136) *Ang nedraye nedrānya.*  
 ang nedra=ye.Ø nedrān-ya  
 AT sit=3SG.F.TOP chair-LOC  
 ‘She sits on a chair.’

With regards to (134a) it is also necessary to mention what Hagège (2010) calls the ‘Proof by Anachrony Principle’ (158–159). According to this principle, when an adposition is very grammaticalized, speakers can use both the adposition and its etymological ancestor side by side without taking offense in the double occurrence. This is notably not the case in Ayeri, where it is not possible to say things like

simple words, for instance, *of*, *at*, *in*, which derive from the slightly more complex PIE forms *\*h<sub>2</sub>ep-ó*, *\*h<sub>2</sub>ed*, *\*h<sub>1</sub>en(-i)*, respectively (Kroonen 2013: 1, 39, 269). Since adpositions frequently grammaticalize into case markers, it may be assumed that the phonologically much more simple case affixes of Ayeri constitute an older layer of basic adpositions. Their non-suffixed forms may be remnants of this use.

<sup>27</sup> The corresponding sentence with a preposition is ሲገባ ላይ ላለው ስኬት ላይ *Le yomareng kanka ling rivanena* ‘There is snow on top of the mountain’ (PT.INAN exist=3SG.INAN.A snow-TOP top mountain-LOC).

(137a), where 𐀓𐀕 *pang* is used in both its meanings so that the preposition 𐀓𐀕 *pang* ‘behind’ governs the original noun 𐀓𐀕 *pang* ‘back’.

- (137) a. \**Le ranice ang Maha adanya pang pangya yena.*  
 le ranit-ye ang Maha adanya-Ø pang pang-ya yena  
 PT.INAN hide-3SG.F A Maha that-TOP back back-LOC 3SG.F.GEN  
 ‘\*Maha hides it at the back of her back.’
- b. *Le ranice ang Maha adanya pangya yena.*  
 le ranit-ye ang Maha adanya-Ø pang-ya yena  
 PT.INAN hide-3SG.F A Maha that-TOP back-LOC 3SG.F.GEN  
 ‘Maha hides it at her back,’  
 or: ‘Maha hides it behind herself.’

Examples like (134b), on the other hand, show that there is nonetheless a tendency in Ayeri towards grammaticalization of nouns which used to be relational. Grammaticalization is visible in that formerly relational nouns have become restricted in the way they can be used syntactically (Lehmann 2015: 174). This specialization is also apparent in morphology from the fact that prepositions in Ayeri, in spite of their nominal origin, cannot be modified by adjectives and relative clauses like regular nouns. Thus, for instance, while 𐀓𐀕 *avan* as a noun can mean ‘soil’ or ‘ground’ and can be modified by semantically coherent adjectives like 𐀓𐀕 *kabu* ‘fertile’, the preposition 𐀓𐀕 *avan* cannot. Again, a grammatical way to express (138b) would have to use 𐀓𐀕 *avan* as a relational noun, that is, 𐀓𐀕𐀕𐀕𐀕𐀕𐀕 *avanya kabu similena* ‘at the fertile bottom of the country’ (bottom-LOC fertile country-GEN). The fact that topicalized heads lack case marking makes adpositions derived from nouns, like 𐀓𐀕 *avan* homophonous with the respective etymologically related preposition.

- (138) a. *Sa yomareng avan kabu ibangya yana.*  
 sa yoma=reng avan-Ø kabu ibang-ya yana  
 PT exist=3SG.INAN.A.INAN ground-TOP fertile field-LOC 3SG.M.GEN  
 ‘Fertile ground is on his field.’
- b. \**Ang mican avan kabu similya*  
 ang mit=yan.Ø avan kabu simil-ya  
 AT live=3PL.M.TOP bottom fertile country-LOC  
 ‘\*They live at the fertile bottom of the country.’

At the beginning of this section it was shown that prepositions in Ayeri cannot receive number and case marking, which are otherwise typical features of nouns. What is possible with regards to affixes, however, is adding degree suffixes to prepositions, since these suffixes are clitics rather than inflections (compare section 3.2.5, p. 94):

Table 4.15: Prepositions (directional)

Preposition	<i>manga</i> + PREP
ᐱᐱᐱᐱ <i>agonan</i> ‘outside’	out
ᐱᐱᐱ <i>avan</i> ‘at bottom’	to the bottom; <i>with DAT/GEN</i> : down to/from
ᐱᐱᐱᐱ <i>eyran</i> ‘under’	under
ᐱᐱᐱᐱᐱ <i>eyrarya</i> ‘over’	across, over
ᐱᐱᐱᐱ <i>kayvo</i> ‘with, beside’	along
ᐱᐱᐱᐱ <i>kong</i> ‘inside’	into
ᐱᐱᐱᐱ <i>ling</i> ‘on top’	onto, while; <i>with DAT/GEN</i> : up to/from
ᐱᐱᐱ <i>luga</i> ‘between’	through, during, for + <i>time</i>
ᐱᐱᐱᐱ <i>marin</i> ‘in front’	to the front
ᐱᐱᐱᐱ <i>miday</i> ‘around’	circling around
ᐱᐱᐱ <i>nasay</i> ‘near’	into the near
ᐱᐱᐱᐱ <i>nuveng</i> ‘left’	to the left
ᐱᐱᐱᐱ <i>pang</i> ‘behind’	behind, to the back
ᐱᐱᐱᐱᐱ <i>patameng</i> ‘right’	to the right

- (139) *Ang mitasaye pang-ikan mandayya tado.*  
 ang mit-asa=ye.Ø pang=ikan manday-ya tado  
 AT live-HAB=3SG.F.TOP back=much forum-LOC old

‘She used to live way behind the old forum.’

As demonstrated before, another quasi-inflection adpositions in Ayeri can carry is the directional marker ᐱᐱᐱ *manga* (see section 3.1). While most of the prepositions in Table 4.14 have a static meaning, ᐱᐱᐱ *manga* indicates a motion in the direction of the respective location, thus ᐱᐱᐱᐱ *kong* ‘inside’ becomes ᐱᐱᐱᐱᐱᐱ *manga kong* ‘into’, for instance. Table 4.15 repeats the table of prepositions above for the most part and gives the respective directional meanings. The prepositions ᐱᐱᐱᐱᐱᐱ *mangasaba* and ᐱᐱᐱᐱᐱᐱ *mangasara* are missing from this list and appear in the previous table instead, even though they express motion rather than position, because they are only used in this base form and cannot be prefixed by ᐱᐱᐱ *manga*, which they already contain. Note, however, that ᐱᐱᐱᐱᐱᐱ *mangasaba* and ᐱᐱᐱᐱᐱᐱ *mangasara* are not synonymous to an adjunct in the dative and the genitive case, respectively. Rather, the prepositions add a more deliberate or literal meaning:

- (140) a. *Ang nimpay kardangyam.*  
 ang nimp=ay.Ø kardang-yam  
 AT run=ISG.TOP school-DAT  
 ‘I’m running to (a/the) school.’  
 (e.g. for class, or just up to the building)
- b. *Ang nimpay mangasaba kardangya.*  
 ang nimp=ay.Ø mangasaba kardang-ya  
 AT run=ISG.TOP towards school-LOC  
 ‘I’m running towards (a/the) school.’  
 (up to the building)
- (141) a. *Ang lampay kardangena.*  
 ang walk=ay.Ø kardang-ena  
 AT walk=ISG.TOP school-GEN  
 ‘I’m walking from (a/the) school.’  
 (e.g. home, or somewhere else from there)
- b. *Ang lampay mangasara kardangya.*  
 ang lamp=ay.Ø mangasara kardang-ya  
 AT walk=ISG.TOP away school-LOC  
 ‘I’m walking away from (a/the) school.’  
 (away from the building)

Also note that while Germanic languages like English make frequent use of set expressions which combine a verb with an intransitive preposition, such as *run away*, *go by*, *raise up*, *track down*, sometimes with rather idiomatic meanings, this pattern does not occur as frequently in Ayeri. Some exceptions are:

- (142) a. ႁႏႱႱႱႱ *il- mangasara* ‘surrender’ (give away),  
 b. ႁႏႱႱႱႱ *lant- mangasara* ‘distract’ (lead away),  
 c. ႁႏႱႱႱႱ *nimp- mangasara* ‘escape’ (run away),  
 d. ႁႏႱႱႱႱ *tapy- dayrin* ‘save (valuable assets)’ (put aside),  
 e. ႁႏႱႱႱႱ *tapy- miday* ‘put on’ (put around),  
 f. ႁႏႱႱႱႱ *tura- mangasaba* ‘forward’ (send towards).

These verbs do not govern a prepositional object in the locative case in their idiomatic meaning, as displayed by the next example, in which ႁႏႱႱႱႱ *batangiman* and ႁႏႱႱႱႱ *sa Ajān* do neither serve as arguments of ႁႏႱႱႱႱ *lanco* or ႁႏႱႱႱႱ *mangasara*, but of the phrasal verb ႁႏႱႱႱႱ *lant- mangasara*.<sup>28</sup>

<sup>28</sup> Colloquially, ႁႏႱႱႱႱ *mangasaba* and ႁႏႱႱႱႱ *mangasara* may be shortened to just ႁႏႱႱ *saba* and ႁႏႱႱ *sara*, respectively.

- (143) *Ang lanco mangasara batangiman sa Ajān.*  
 ang lant-yo mangasara batangiman-Ø sa Ajān  
 AT lead-3SG.N away mosquito-TOP P Ajān  
 ‘The mosquito distracted Ajān.’

Very often, where the verb expression in English contains a preposition, there is a separate verb in Ayeri, or the same verb is used in Ayeri for both the plain English verb and the one extended by a preposition:

- (144) a. ၵၢ်လၢ: *apand-* ‘descend, climb down’,  
 b. ၵၢ်လၢ: *dila-* ‘figure out, find out’,  
 c. ၵၢ်လၢ: *ling-* ‘ascend, mount, climb up’,  
 d. ၵၢ်လၢ: *naga-* ‘watch after’,  
 e. ၵၢ်လၢ: *pah-* ‘remove, take away’,  
 f. ၵၢ်လၢ: *subr-* ‘cease, give up’.
- (145) a. ၵၢ်လၢ: *ka-* ‘throw (away)’,  
 b. ၵၢ်လၢ: *mat-* ‘warm (up)’,  
 c. ၵၢ်လၢ: *sikl-* ‘rip (up)’.

In cases where the preposition does not have a prepositional object otherwise, its double nature as a noun comes to the fore in that the preposition word will be treated like a noun if it is denominal and carries the appropriate case marker itself:

- (146) a. *Ang sabayan manga pang nangaya.*  
 ang saha=yan.Ø manga pang nanga-ya  
 AT go=3PL.TOP DIR back house-LOC  
 ‘They go behind the house.’
- b. *Ang sabayan pangyam.*  
 ang saha=yan.Ø pangyam  
 AT go=3PL.TOP back-DAT  
 ‘They go behind (it),’  
 or: ‘They go to the back.’

#### 4.4.2 Postpositions

While Ayeri mainly uses prepositions—which is by far the most common order for VO languages (Dryer 2013b)—it also uses a number of postpositions, which are given in Table 4.16. As can be read from the table, postpositions do not usually have a nominal origin but are derived either from other prepositions, from adverbial

Table 4.16: Postpositions

	Postposition	Etymology (or related to)
𑌕𑌃𑌕𑌃𑌕𑌃	<i>da-nārya</i>	despite, in spite of
𑌕𑌃𑌕𑌃𑌕𑌃	<i>kayvay</i>	without
𑌕𑌃𑌕𑌃𑌕𑌃	<i>masabatay</i>	since
𑌕𑌃𑌕𑌃𑌕𑌃	<i>nasyam</i>	according to
𑌕𑌃𑌕𑌃𑌕𑌃	<i>pang</i>	beyond, after, past
𑌕𑌃𑌕𑌃𑌕𑌃	<i>pesan</i>	until
𑌕𑌃𑌕𑌃𑌕𑌃	<i>ran</i>	against
𑌕𑌃𑌕𑌃𑌕𑌃	<i>rayu</i>	diagonally across
𑌕𑌃𑌕𑌃𑌕𑌃	<i>yamva</i>	instead of

phrases, or even from an adjective in the case of 𑌕𑌃𑌕𑌃𑌕𑌃 *rayu*. The etymologies of 𑌕𑌃𑌕𑌃𑌕𑌃 *pesan* and 𑌕𑌃𑌕𑌃𑌕𑌃 *yamva* are unclear to date.

The postposition 𑌕𑌃𑌕𑌃𑌕𑌃 *pang* is special in that it also exist as a preposition meaning ‘behind, in the back of’, though as a postposition it acquires the related but slightly different meaning ‘beyond, after, past’. It might thus be better treated as a homonym to the preposition rather than as an ambiposition (Hagège 2010: 115). Example (147a) illustrates the use of 𑌕𑌃𑌕𑌃𑌕𑌃 *pang* as a preposition, (147b) the use of 𑌕𑌃𑌕𑌃𑌕𑌃 *pang* as a postposition. This is in contrast to typical ambipositions like German *wegen* ‘because of, due to’ in (148), which has the same meaning in either position and the position variant is just a matter of style.

- (147) a. *Sa lancāng pel manga pang penungya.*  
 sa lant=yāng pel-Ø manga pang penung-ya  
 PT lead=3SG.M.A horse-TOP DIR back barn-LOC  
 ‘The horse, he leads it behind the stable.’
- b. *Lesyo pelang si sã nimp̄yong penungya pang yan.*  
 les-yo pel-ang si sã nimp̄=yong penung-ya pang yan.Ø  
 fall-3SG.N horse-A REL CAUT run=3SG.N.A stable-LOC back 3PL.TOP  
 ‘The horse they raced past the barn fell.’

- (148) German:
- a. *wegen des schlechten Wetters*  
 wegen des schlecht-en Wetter-s  
 because.of DEF.GEN.N.SG bad-GEN.N.SG weather-GEN  
 ‘because of the bad weather’

Table 4.17: Adpositions with temporal meaning

Adposition	Spatial meaning	Temporal meaning
Prepositions		
ቋጉ <i>kong</i>	inside	within
ሰገጉ <i>ling</i>	on top of	while
ጠገገ <i>marin</i>	in front of	before
ጠገገገ <i>manga luga</i>	through	during
ጠገገገገ <i>mangasaba</i>	towards	in + <i>time</i>
ገገ <i>pang</i>	behind	ago
Postpositions		
ጠገገገገገ <i>masabatay</i>	—	since
ሰገገ <i>pesan</i>	—	until
ገገ <i>pang</i>	beyond, after	after, past

- b. *des schlechten Wetters wegen*  
 des schlecht-en Wetter-s wegen  
 DEF.GEN.N.SG bad-GEN.N.SG weather-GEN because.of  
 (idem)

Besides the difference in placement, the morphological properties of postpositions are the same as those of prepositions. That is, where postpositions are derived from nouns at all, they do not receive case and number marking and cannot themselves be modified by adjectives or relative clauses. Generally, it is possible for them to be hosts of quantifier clitics where semantics permit it.

#### 4.4.3 Adpositions and time

It has been mentioned above that location also serves as the conceptual metaphor for expressing temporal relationships. Notably the prepositions ቋጉ *kong* ‘inside’, ሰገገ *ling* ‘on’, ጠገገ *marin* ‘in front of’, ጠገገገ *manga luga* ‘through’, ጠገገገገ *mangasaba* ‘towards’, and ገገ *pang* ‘behind’ come to mind as doubling for ‘within’, ‘while’, ‘before’, ‘during’, ‘in + *time*’, and ‘ago’, respectively (also see Table 4.17). Since postpositions are not primarily derived from nouns, there are dedicated forms for expressing temporal relationships, namely, ጠገገገገገ *masabatay* ‘since’, ሰገገ *pesan* ‘until’, and as the only form with a double function, ገገ *pang* ‘after, past’.

- (149) a. *Miranang kong bihanya sam.*  
 mira=nang kong bihan-ya sam  
 do=IPL.A inside week-LOC two  
 'We will do it within two weeks.'
- b. *Girenjang mangasaha pidimya-kay.*  
 girend=yang mangasaha pidim-ya=kay  
 arrive=3SG.M.A towards hour-LOC=few  
 'He will arrive in a few hours.'
- c. *Layaye-ikan ang Pila ling yeng pakur.*  
 laya-ye=ikan ang Pila ling yeng pakur  
 read-3SG.F=much A Pila on 3SG.F.A sick  
 'Pila read a lot while she was sick.'

Of the examples above, the use of ꨀꨣꨣ *kong* in (149a) is probably still closest to a local preposition in that the time span is conceptualized as a container, or the distance between two points. The use of ꨀꨣꨣꨣꨣ *mangasaha* in (149b), on the other hand, is more idiomatic. While the prepositions in these two examples each govern an NP, example (149c) shows that it is also possible for prepositions expressing a temporal relationship to govern a subclause. This ability is even more prominent with temporal postpositions in that all of the words listed above can govern either an NP or a clause, for instance, ꨀꨣꨣꨣꨣ *masahatay*:

- (150) a. *Ang manga hangya lakayperinya masahatay.*  
 ang manga hang=ya.Ø lakayperin-ya masahatay  
 AT PROG stay=3SG.M.TOP solstice-LOC since  
 He has been staying since the solstice.
- b. *Yeng giday sarayāng masahatay.*  
 yeng giday sara=yāng masahatay  
 3SG.F.A sad leave=3SG.M.A since  
 'She has been sad since he left.'

## 4.5 Verbs

Besides nouns, verbs constitute the other main part of speech in Ayeri which carries inflections. Verbs show person and number agreement, but may also inflect for tense, aspect, mood, and modality as grammatical categories of the verb itself. Personal pronouns may furthermore cliticize to the verb stem, and the verb phrase is also often marked with a clitic indicating the topic of the sentence and the topic NP's role in Ayeri's case system, which can be interpreted as a second agreement

Table 4.18: Conjugation paradigm for ᱥᱟᱱ: *sob*- ‘learn, teach’ (monoconsonantal root)

Person	Topicalized <sup>29</sup>	Clitic agent	Translation
1SG	<i>sobay</i>	<i>sobyang</i>	‘I learn’
2SG	<i>sobva</i>	<i>sobvāng</i>	‘you learn’
3SG.M	<i>sobya</i>	<i>sobyāng</i>	‘he learns’
3SG.F	<i>sobye</i>	<i>sobyeng</i>	‘she learns’
3SG.N	<i>sobyō</i>	<i>sobyong</i>	‘it learns’
3SG.INAN	<i>sobara</i>	<i>sobreng</i>	‘it learns’
IPL	<i>sobayn</i>	<i>sobnang</i>	‘we learn’
2PL	<i>sobva</i>	<i>sobvāng</i>	‘you learn’
3PL.M	<i>sobyan</i>	<i>sobtang</i>	‘they learn’
3PL.F	<i>sobyen</i>	<i>sobteng</i>	‘they learn’
3PL.N	<i>sobyon</i>	<i>sobtong</i>	‘they learn’
3PL.INAN	<i>sobaran</i>	<i>sobteng</i>	‘they learn’
IMP	<i>sobu!</i>	‘learn!’

ITER	<i>so-sob-</i>	‘learn again, relearn’	
PTCP	<i>sobyam</i>	‘learning’	

relation. Further clitics may indicate reflexive actions, progressive aspect, likeness, logical connection, as well as degree and measure. Verbs are thus probably the most versatile part of speech on the one hand, but also the one with the heaviest workload on the other. The following sections will dissect the morphology of verbs category by category. Because verbs inhabit a central position in syntax and exhibit agreement morphology, it will be necessary in this section to merge syntax and morphology on occasion in order to describe morphosyntactic effects.

#### 4.5.1 Person marking

As described in section 3.3, Ayeri conjugates its main verbs, canonically in agreement with the agent NP, and verb conjugation as such is extremely pervasive. The basic conjugation paradigms are given in Tables 4.18–4.20.<sup>30</sup> Agreement causes verbs to reflect grammatical categories of nominal entities, thus, verbs show agreement in

<sup>29</sup> Third-person topicalized forms are homonymous with third-person agreement forms.

<sup>30</sup> Due to the agglutinating structure of Ayeri it makes little sense to list the whole paradigm of verb inflection for all possible affix combinations here, as the table would become unreasonably

Table 4.19: Conjugation paradigm for ၼ်း: *anl-* ‘bring’ (biconsonantal root)

Person	Topicalized	Clitic agent	Translation
1SG	<i>anlay</i>	<i>anlyang</i>	‘I bring’
2SG	<i>anlava</i>	<i>anlavāng</i>	‘you bring’
3SG.M	<i>anlya</i>	<i>anlyāng</i>	‘he brings’
3SG.F	<i>anlye</i>	<i>anlyeng</i>	‘she brings’
3SG.N	<i>anlyo</i>	<i>anlyong</i>	‘it brings’
3SG.INAN	<i>anlara</i>	<i>anlareng</i>	‘it brings’
IPL	<i>anlayn</i>	<i>anlanang</i>	‘we bring’
2PL	<i>anlava</i>	<i>anlavāng</i>	‘you bring’
3PL.M	<i>anlyan</i>	<i>anlatang</i>	‘they bring’
3PL.F	<i>anlyen</i>	<i>anlateng</i>	‘they bring’
3PL.N	<i>anlyon</i>	<i>anlatong</i>	‘they bring’
3PL.INAN	<i>anlaran</i>	<i>anlateng</i>	‘they bring’
IMP	<i>anlu!</i>	‘bring!’	
HORT	<i>anlu-anlu!</i>	‘let’s bring!’	
ITER	<i>an-anl-</i>	‘bring again, bring back’	
PTCP	<i>anlyam</i>	‘bringing’	

person (1, 2, 3) and number (SG, PL); third persons are again differentiated by gender (M, F, N, INAN; compare section 4.1.1). Verbs only have agreement proper with third persons; their form, then, is the same as that of verbs with topicalized pronominal inflection (see section 4.2.1).

Regarding person–number inflection, verbs may be divided into three classes: monoconsonantal, biconsonantal, and vocalic stems. As discussed in section 1.2, Ayeri restricts the number of successive non-glides consonants to two, which has repercussions in the second person, since the conjugation suffix there is *-va*. Monoconsonantal roots are unaffected by this restriction, however, hence the conjugation suffixes can simply be appended as they are; this is illustrated with the verb ၼ်း: *sob-* ‘teach, learn’ in Table 4.18. Verb stems ending in dental and velar plosives will naturally undergo palatalization in the third person animate, so for instance, the third person singular masculine of the verb ၼ်း: *gurat-* ‘answer’ is ၼ်း: *guraca* ‘(he) answers’, and the third person feminine plural of ၼ်း: *abag-* ‘roam, wander’ is ၼ်း: *abajen* ‘(they) roam, (they) wander’. Verbs whose stem ends in an affricate are

large. Instead, the various sections below will contain examples of use for all affixes.

Table 4.20: Conjugation paradigm for 𐌵: *no-* ‘want’ (vocalic root)

Person	Topicalized	Clitic agent	Translation
1SG	<i>noay</i>	<i>noyang</i>	‘I want’
2SG	<i>nova</i>	<i>novāng</i>	‘you want’
3SG.M	<i>noya</i>	<i>noyāng</i>	‘he wants’
3SG.F	<i>noye</i>	<i>noyeng</i>	‘she wants’
3SG.N	<i>noyo</i>	<i>noyong</i>	‘it wants’
3SG.INAN	<i>noara</i>	<i>noreng</i>	‘it wants’
IPL	<i>noayn</i>	<i>nonang</i>	‘we want’
2PL	<i>nova</i>	<i>novāng</i>	‘you want’
3PL.M	<i>noyan</i>	<i>notang</i>	‘they want’
3PL.F	<i>noyen</i>	<i>noteng</i>	‘they want’
3PL.N	<i>noyon</i>	<i>notong</i>	‘they want’
3PL.INAN	<i>noaran</i>	<i>noteng</i>	‘they want’
IMP	<i>nu!</i>	‘want!’	
HORT	<i>nu-nu!</i>	‘let’s want!’	
ITER	<i>no-no-</i>	‘want again’	
PTCP	<i>noyam</i>	‘wanting’	

treated as monoconsonantal roots as well, since the affricate occupies one consonant phoneme segment. Thus, the second person of 𐌵: *ic-* ‘glide, slide’ is not \*𐌵: *icava*, but 𐌵: *icva* ‘you glide, you slide’.

Since /v/ is neither a vowel nor a glide, as present in the non-second person suffixes, an epenthetic *-a-* is inserted between the stem and the second-person suffix for verbs whose stem ends in *-CC*.<sup>31</sup> This is illustrated in Table 4.19 for the verb 𐌵: *anl-* ‘bring’. The second person conjugation of this verb is not \*𐌵: *anlva*, since the cluster *-nlv-* is illegal, but 𐌵: *anlava*. Since Ayeri treats two successive instances of the same consonant as a single segment—there is no gemination—verbs like 𐌵: *silv-* ‘see’ conjugate like monoconsonantal roots with regards to consonant clusters. That is, the second person of 𐌵: *silv-* is not \*𐌵: *silvava*, as one might expect, but 𐌵: *silvva*. A further exception to this are verbs ending in *-Cs*, since *-Cs-C-* is commonly resyllabified as *-C-sC-* (see chapter 1, footnote 13). Thus, the

<sup>31</sup> A *root* is understood here as the uninflected verb morpheme, for instance, 𐌵: *anl-*, 𐌵: *ic-*, 𐌵: *no-*, or 𐌵: *sob-*. A *stem* may contain inflections and further inflectional affixes attach to it; it may also host clitics.

Table 4.21: Conjugation paradigm for ၼာ: *apa-* ‘laugh’ (vocalic root in -a)

Person	Topicalized	Clitic agent	Translation
1SG	<i>apāy</i>	<i>apayang</i>	‘I laugh’
2SG	<i>apava</i>	<i>apavāng</i>	‘you laugh’
3SG.M	<i>apaya</i>	<i>apayāng</i>	‘he laughs’
3SG.F	<i>apaye</i>	<i>apayeng</i>	‘she laughs’
3SG.N	<i>apayo</i>	<i>apayong</i>	‘it laughs’
3SG.INAN	<i>apāra</i>	<i>apareng</i>	‘it laughs’
IPL	<i>apāyn</i>	<i>apanang</i>	‘we laugh’
2PL	<i>apava</i>	<i>apavāng</i>	‘you laugh’
3PL.M	<i>apayan</i>	<i>apatang</i>	‘they laugh’
3PL.F	<i>apayen</i>	<i>apateng</i>	‘they laugh’
3PL.N	<i>apayon</i>	<i>apatong</i>	‘they laugh’
3PL.INAN	<i>apāran</i>	<i>apateng</i>	‘they laugh’
IMP	<i>apu!</i>	‘laugh!’	
HORT	<i>apu-apu!</i>	‘let’s laugh!’	
ITER	<i>ap-apa-</i>	‘laugh again’	
PTCP	<i>apayam</i>	‘laughing’	

second-person form of ၼာ: *kars-* ‘freeze’ is not \**ၼာ: karsava* as expected, but *ၼာ: karsva* ‘you freeze’.

Lastly, verb stems may end in a vowel, most commonly *-a*. In these cases as well, the conjugation suffixes may simply be appended to the stem. The conjugation of this class is illustrated in Table 4.20 with the verb ၼာ: *no* ‘want’. Verb stems ending in *-a* undergo the regular vowel lengthening process for the first person suffixes, hence, the topicalized first-person singular form of ၼာ: *apa-* ‘laugh’ is ၼာ: *apāy* ‘I laugh’ (compare Table 4.21). Verb stems ending in a diphthong in /ɪ/ are essentially treated as a hybrid of monoconsonantal and vocalic stems, since the diphthong’s final /ɪ/ is treated as /j/ before a vowel: ၼာ: *palayay* ‘I rejoice’, ၼာ: *palayva* ‘you rejoice’.

As mentioned above, the person marking on verbs is essentially the same as the topic-marked personal pronouns. This has further ramifications for person-marking on verbs, however, in that in canonical cases, even fully case-marked agent pronouns may act as person marking by means of cliticization. Thus, any person-marking on verbs except third-person agreement is, in fact, a topicalized pronoun clitic not only by diachronic origin. Unlike English, Ayeri does not use agent

pronouns in addition to person agreement on verbs. Consider these two example sentences in English:

- (151) a. *John greets Mary.*  
           John greet-s Mary  
           John greet-3SG.PRS Mary
- b. *He greets Mary.*  
           he greet-s Mary  
           3SG.M greet-3SG.PRS Mary

In these examples, the verb has an agreement suffix *-s* which indicates third person singular, present tense, whether the subject of the sentence is a noun (*John*) or a pronoun (*he*), which acts as a free morpheme in English. Now consider the Ayeri equivalents of these two examples, on the other hand:<sup>32</sup>

- (152) a. *Ang manya Ajān sa Pila.*  
           ang man-ya Ø Ajān sa Pila  
           AT greet-3SG.M TOP Ajān[3SG.M] P Pila[3SG.F]  
           ‘Ajān greets Pila.’
- b. *Ang manya sa Pila.*  
           ang man=ya.Ø sa Pila  
           AT greet=3SG.M.TOP P Pila[3SG.F]  
           ‘He greets Pila.’

It is probably uncontroversial to analyze *man-ya* in (152a) as person agreement: *ᑭᑭᑭ Ajān* is a male name in Ayeri while *ᑭᑭ Pila* is a feminine one; the verb inflects for a masculine third person, which tells us that it agrees with the one doing the greeting, Ajān. Ajān is also who this is about, which is shown on the verb by marking for an agent topic. In the second case, there is only anaphoric reference to Ajān; the full agent NP is not realized. Very broadly thus, the verb marking here seems to be like in Spanish, where you can drop the subject pronoun:

- (153) Spanish:
- a. *Juan saluda a María.*  
           Juan salud-a a María  
           John greet-3SG ACC Mary  
           ‘John greets Mary.’

<sup>32</sup> Most of the following account is taken nearly verbatim from a previously published blog article, Becker (2016d). Some of the Ayeri examples used in the following come from a list of samples I provided for a bachelor’s thesis at the University of Kent in March 2016, in private conversation, on request.

- b. *Saluda a María.*  
 salud-a a María  
 greet-3SG ACC Mary  
 ‘He greets Mary.’

Example (152b) probably does not seem conspicuous if we assume that Ayeri is pro-drop, except that there is also topic marking for an agent there, the controller of which I have so far assumed to be the person inflection on the verb, in analogy with examples like the following:

- (154) *Lampyāng.*  
 lamp=yāng  
 walk=3SG.M.A  
 ‘He walks.’

This raises the question whether in Ayeri, there is dropping of an agent pronoun involved at all, which is why the person suffix in (152b) was glossed as =*ya.Ø* (=3SG.M.TOP) rather than just as *-ya* (-3SG.M). In turn, this question leads us to consider another characteristic of Ayeri, namely that the topic morpheme on noun phrases is zero. That is, the absence of overt case marking on a nominal element indicates that it is a topic; the verb in turn marks the case of the topicalized NP with a (case) particle preceding it. Pronouns as well show up in their unmarked form when topicalized, which is why I am hesitant to analyze the pronoun in (155b) as a clitic on the VP rather than an independent morpheme:<sup>33</sup>

- (155) a. *Sa manya ang Ajān Pila.*  
 sa man-ya ang Ajān Ø Pila  
 PT greet-3SG.M A Ajān TOP Pila  
 ‘It’s Pila that Ajān greets.’  
 b. *Sa manyāng ye.*  
 sa man=yāng ye.Ø  
 PT greet=3SG.M.A 3SG.F.TOP  
 ‘It’s her that he greets.’

What is remarkable, then, is that *ye* (3SG.F.TOP) is the very same form that appears as an agreement morpheme on the verb, just like *-ya* (3SG.M) in various examples above (also compare the examples in section 4.2.1):

<sup>33</sup> Also, perhaps a little untypically, topic NPs in Ayeri are not usually pulled to the front of the phrase (at least not in the written language; see Lehmann 2015: 120–122), so topic-marked pronouns stay in-situ. Which NP constitutes the topic of the phrase is marked on the verb right at the head of the clause. How and whether this can be justified in terms of grammatical weight (see, for instance, Wasow 1997: 95–98) remains to be seen.

- (156) *Ang purivaye yāy.*  
 ang puriva=ye.Ø yāy  
 AT smile=3SG.F.TOP 3SG.M.LOC  
 ‘She smiles at him.’

This also holds for all other personal pronouns. Moreover, *yāy* as seen in examples (154) and (155b) may also be used as a free pronoun in equative statements with predicative nominals, as well as other such case-marked personal forms:

- (157) a. *Yeng mino.*  
 yeng mino  
 3SG.F.A happy  
 ‘She is happy.’  
 b. *Yāng naynay.*  
 yāng naynay  
 3SG.M.A too  
 ‘He is, too.’

As for case-marked person suffixes on verbs, the assumption so far has been that they are essentially clitics, especially since the following marking strategy is the grammatical one in absence of an agent NP (compare section 3.2.5, p. 89):

- (158) a. *Manye sa Pila.*  
 man-ye sa Pila  
 greet-3SG.F P Pila  
 ‘Pila is being greeted.’  
 b. *Manyes.*  
 man=yes  
 greet=3SG.F.P  
 ‘She is being greeted.’

The verb here agrees with the patient—or is it that person agreement suffixes on verbs are generally clitics in Ayeri, even where they do not involve case marking? There seems to be a gradient here between what looks like regular verb agreement with the agent on the one hand, and agent or patient pronouns just stacked onto the verb stem on the other hand. For an overview, compare Table 4.22. In this table, especially the middle, transitional category is interesting in that what looks like verb agreement superficially can still govern topicalization marking, which is indicated in column II by an index ‘I’. Note that this behavior only occurs in transitive contexts; there is no topic marking on the verb if the verb only has a single NP dependent. Also consider that for example (b) in the type III transitive cell the question is,

whether this should not better be analyzed as AT ...-3SG.M.TOP ...-TOP ...-P, with co-indexing of the topic on the person inflection of the verb, making it structurally closer to type II.

As for personal pronouns fused with the verb stem like in the first column, Corbett (2006) points out that

In terms of syntax, pronominal affixes are arguments of the verb; a verb with its pronominal affixes constitutes a full sentence, and additional noun phrases are optional. If pronominal affixes are the primary arguments, then they agree in the way that anaphoric pronouns agree [...] In terms of morphology, pronominal affixes are bound to the verb; typically they are obligatory [...]. (99–100)

This seems to be exactly what is going on for instance in (154) and (158b), where the verb forms a complete sentence. It needs to be pointed out that Corbett includes an example from Tuscarora, a native American polysynthetic language, in relation to the above quotation. Ayeri should not be considered polysynthetic, however, since its verbs generally do not exhibit relations with multiple NPs, at least as far as person and number agreement is involved (Comrie 1989: 45–46).<sup>34</sup>

Taking everything written above so far into account, it looks much as though Ayeri is in the process of grammaticalizing personal pronouns into person agreement (Lehmann 2015: 42–45; Gelderen 2011: 493–497). Corbett (2006) illustrates an early stage of such a process:

(159) Skou (Corbett 2006: 76–77):

- a. *Ke móe ke=fue.*                      (\**Ke móe fue.*)  
      3SG.M fish 3SG.M=see.3SG.M  
      ‘He saw a fish.’
- b. *Pe móe pe=fu.*                      (\**Pe móe fu.*)  
      3SG.F fish 3SG.F=see.3SG.F  
      ‘She saw a fish.’

What Gelderen (2011) calls the *subject cycle*, the “oft-noted cline expressing that pronouns can be reanalyzed as clitics and agreement markers” (493) applies here, and as well in Ayeri. However, while she continues to say that in “many languages, the agreement affix resembles the emphatic pronoun and derives from it” (494), Ayeri does at least in part the opposite and uses the case-unmarked form of personal

<sup>34</sup> The topic NP marked on the verb may be a different from the one with which the verb agrees in person and number, so technically, Ayeri verbs *may* agree with more than one NP in a very limited way (compare section 3.3). Still, I would not analyze this as polypersonal agreement, since there is only canonical verb agreement with one constituent, that is, the agent NP. Topic marking should, in my opinion, be viewed as a separate agreement relation, as pointed out in the quoted section above.

Table 4.22: Verb inflection types in Ayeri

	Type I: Clitic pronouns	Type II: Transitional	Type III: Verb agreement
Inflectional categories	Person Number Case	Person Number Case/Topic	Person Number
Examples (intransitive)	...=yāng ...=3SG.M.A	—	...-ya <sub>1</sub> ...-ang <sub>1</sub> ...-3SG.M ...-A
Examples (transitive)	sa <sub>1</sub> ...=yāng ...-Ø <sub>1</sub> PT ...=3SG.M.A ...-TOP	ang <sub>1</sub> ...=ya.Ø <sub>1</sub> ...-as AT ...=3SG.M.TOP ...-P	a. ang <sub>1</sub> ...-ya <sub>1</sub> ...-Ø <sub>1</sub> ...-as AT ...-3SG.M ...-TOP ...-P  b. a <sub>1</sub> ...-ya <sub>2</sub> ...-ang <sub>2</sub> ...-Ø <sub>1</sub> PT ...-3SG.M ...-A ...-TOP

Table 4.23: The syntax and morphology of pronominal affixes (Corbett 2006: 101)

Syntax:	non-argument	argument	
Linguistic element:	‘pure’ agreement marker	pronominal affix	free pronoun
Morphology:	inflectional form		free form

pronouns for what resembles verb agreement most closely. This, however, should not be too controversial either, considering that, for instance, semantic bleaching and phonetic erosion go hand in hand with grammaticalization (Lehmann 2015: 136–137; Gelderen 2011: 497).

As pointed out above in (158), Ayeri usually exhibits verbs as agreeing with agents and occasionally patients, not topics as such. This may be a little counterintuitive since the relation between topics and subjects is close, but is possibly due to the fact that the unmarked word order is VAP. This means that agent NPs usually follow the verb, and does not seem too unnatural to have an agreement relation between the verb and the closest NP also when non-conjoined NPs are involved (Corbett 2006: 180). This conveniently explains why verbs can agree with patients as well if the agent NP is absent. Taking into account that the grammaticalization process is still ongoing so that there is still some relative freedom in how morphemes may be used if a paradigm has not yet fully settled (Lehmann 2015: 148–150) also makes this seem less strange. Verbs simply become agreement targets of the closest semantically plausible nominal constituent. Ayeri seems to be shifting from topics to subjects, and as a consequence the bond between agents and verbs is strengthened due to their usual adjacency; developing verb agreement with agents may be seen as symptomatic of this change.<sup>35</sup>

Signs so far point towards Ayeri’s person agreement in fact being more likely enclitic pronominal affixes. The question is, then, how this might be corroborated. Corbett (2006) offers a typology here, see Table 4.23. According to this typology, a pronominal affix is syntactically an argument of the verb but has the morphology

<sup>35</sup> When translating things in Ayeri, I find myself very often using agent topics, which may be because I am used to subjects proper. Supposing that this is also what Ayeri prefers in-universe, it would make sense to assume the usual grammaticalization path by which topics become subjects, thereby also leading to subject-verb agreement by means of resumptive pronouns referring back to left-dislocated topics (Lehmann 2015: 121–122; Gelderen 2011: 499–500). Lehmann (2015: 120) gives colloquial French *Jean, je l’ai vu hier* ‘John, I saw him yesterday’ as an example here: the object clitic *l’* (← *le* ‘him’) may well develop into an agreement affix (also see Gelderen (2011: 498) on a dialect of Spanish in which, she argues, this has happened). Ayeri in its present form does not use clitic doubling (Spencer and Luís 2012: 153–161), however.

of an inflectional form (compare section 3.2.5, p. 89). If we compare this to the gradient given in Table 4.22 above, it becomes evident that type I definitely fulfills these criteria, and type II does so as well, in fact, in that there is no agent NP that could serve as a controller if the verb inflection in type II were ‘merely’ an agreement target. The inflection in type III, on the other hand, appears to have all hallmarks of agreement in that there is a controller NP that triggers it, with the verb serving as an agreement target. Moreover, the person marking on the verb is not a syntactic argument of the verb in this case. As example (158a) shows, however, marking of type III permits the verb to mark more than one case role, which makes it slightly atypical, although verbs can only carry a single instance of person marking (Corbett 2006: 103). Regarding referentiality, the person suffixes on the verb in table 1, columns I and II are independent means of referring to discourse participants mentioned earlier, whereas the person suffix in III needs support from an NP in the same clause as a source of morphological features to share:

- (160) a. *Ajān ... Ang manya sa Pila.*  
           *Ajān ... Ang man=ya.Ø sa Pila*  
           *Ajān ... AT greet=3SG.M.TOP P Pila*  
           ‘*Ajān ... He greets Pila.*’
- b. *Ajān ... Sa manyāng Pila.*  
           *Ajān ... Sa man=yāng Ø Pila*  
           *Ajān ... PT greet=3SG.M.A TOP Pila*  
           ‘*Ajān ... It’s Pila that he greets.*’
- c. \**Ajān ... Manya sa Pila.*  
           *Ajān ... Man-ya sa Pila*  
           *Ajān ... greet-3SG.M P Pila*

Since person marking of the type I and II is *referential*, as shown in example (160a) and (160b), it can be counted as a cliticized pronoun (Corbett 2006: 103). Pronouns in Ayeri can also refer to non-people—there are both a ‘neuter’ gender for non-people considered living (or being closely associated with living things), and an ‘inanimate’ gender for the whole rest of things (compare section 4.1.1). Since mere agreement as in type III needs support from an NP within the verb’s scope, though, it does not have *descriptive/lexical content* of its own. That is, it *only* serves a grammatical function (104), not strictly as an anaphora. As for Corbett (2006)’s *balance of information* criterion, Table 4.22 also highlights differences in what information is provided by the person marking. Nouns in Ayeri inherently bear information on person, number, and gender, and all three types of person inflection on verbs share these features. However, there are no extra grammatical features indicated by the first two inflection types that are not expressed by noun phrases, although under a very close understanding of Corbett (2006), the following example (161) may still

qualify as person-marking on the verb realizing a grammatical feature shared with an NP that is not openly expressed by the NP. Corbett (2006) writes that in the world's languages, this frequently is number (105). This, however, does not apply to Ayeri because the only time verbs display number not expressed overtly by inflection on a noun is in agreement like in type III (a):<sup>36</sup>

- (161) *Ang sabayan ayon kay kong nangginoya.*  
 ang saha-yan ayon-Ø kay kong nanggino-ya  
 AT come-3PL.M man-TOP three into tavern-LOC

‘Three men come into a pub.’

As shown above, verb marking of the types I and II is independent as a reference, so there is *unirepresentation* of the marked NP. In contrast, verb marking of type III requires a controlling NP in the same clause to share grammatical features with, so that there is *multirepresentation* typical of canonical agreement (Corbett 2006: 106). A further property that hinges on types I and II being independent pronouns glued to verbs as clitics is that they are not coreferential with another NP of the same grammatical relation, but are in complementary distribution, as commonly assumed with pronominals (108). Hence, either of these two examples is ungrammatical:

- (162) a. \**Lampyāng ang Ajān.*  
 lamp=yāng ang Ajān  
 walk=3SG.M.A A Ajān  
 b. \**Ang lampyāng Ajān.*  
 ang lamp=yāng Ø Ajān  
 AT walk=3SG.M.A TOP Ajān

However, verb agreement with a free pronoun is also not possible even though it might be expected according to (Corbett 2006: 109)—also compare example (151b) above. Instead, the agent pronoun replaces any possible person agreement on the verb (see section 3.2.5, p. 89 ff., for an attempt to explain this effect from a syntactic point of view):

- (163) a. *Lampyāng.*  
 lamp=yāng  
 walk=3SG.M  
 ‘He walks.’  
 b. \**Lampya yāng.*  
 lamp-ya yāng  
 walk-3SG.M 3SG.M.A

<sup>36</sup> From a Lexical-Functional Grammar point of view, the number feature of *kay* in (161) coalesces with the semantic features provided by *ayon* in the maximal projection; agreement is thus with the whole agent NP rather than just with *ayon* as the NP's categorial head.

In conclusion, we may assert that Ayeri appears to be in the process of grammaticalizing pronouns as verb inflections, however, how far this grammaticalization process has progressed is dependent on syntactic context. Ayeri displays a full gamut from personal pronouns (usually agents) glued to verbs as clitics to agreement with coreferential NPs that is transparently derived from these personal pronouns. With the latter, the complication arises that coreferential pronoun NPs are not allowed as agreement controllers as one might expect, but only properly nominal NPs. Slight oddities with regards to Austronesian alignment—Ayeri's actors bear more similarities to subjects than expected, but still without fully conflating the two notions—can possibly be explained by a strengthening of the verb-agent relationship pointed out as a grammaticalization process in this article as well. Information on agreement with committee nouns and coordinated NPs with incongruent agreement features can be found in the section on VPs.

#### 4.5.2 Tense

Tense in Ayeri is often not explicitly marked, but has to be inferred from context. However, where marked, Ayeri distinguishes past and future as referring to past and future events, respectively. Both past and future tenses come with three degrees each: near, recent/impending, and remote. Ayeri's distinguishing three degrees of both past and future time is a little unusual with regards to typology according to the survey conducted by Dahl (1985: 127). The decision for which subtier of the past and the future to use is up to pragmatics, that is, there are no definitive and clear-cut lines. The near-time markers are most commonly used for immediate scope, that is, things which have just happened or will happen in a moment. The recent/impending-time markers may then be used for anything else which does not qualify as remote, that is, a long time into the past or the future from the point of view of the speaker.

Dahl (1985: 117) further notes that among the languages in the surveyed sample, past tenses are mostly marked by suffixes, the marking of this category being extremely common in addition. Ayeri may thus be a little unusual crosslinguistically again by exclusively using prefixes for tense marking. This makes sense, however, if we assume that historically, the tense prefixes once were auxiliary verbs. Ayeri applies head-first word order to subordinating verbs, as we will see further below, so these prefixes may just have begun to *procliticize* instead of slipping into a position behind their head (that is, Wackernagel's position).

Of the triad tense–aspect–mood this section will only cover basic uses of the marked tense categories, followed by a discussion of complex tense combinations such as past-in-future. The subsequent section 4.5.3 will provide more insight into the morphological marking of aspectual categories; section 4.5.4 deals with the morphology of mood marking in Ayeri.

*Present tense*

Verbs in Ayeri are unmarked for present tense, as it is the normal mode of speaking. Besides being used to comment or report on current events, the present tense is also used to make statements of general truth:

- (164) *Sa arapyo tabanyamanang koyana nogalam-ikan.*  
 sa arap-yo tahanyaman-ang koya-na nogalam-Ø=ikan  
 PT require-3SG.N writing-A book-GEN patience-TOP=much  
 ‘Writing a book requires much patience.’

Moreover, Ayeri does not strictly mark its verbs for past tense in narrative discourses—verbs may thus appear as though with a present-time reference in spite of recounting past events, whether historical or fictional. See the next subsection on the past tense.

*Past tense*

The past tense indicates actions in the past if not further modified. The three degrees of past tense are marked with *ǎ*: *kə-* (near/immediate), *ǝ*: *mə-* (recent), and *ɾ*: *və-* (remote), which attach right in front of a verb root. In spite of the customary spelling of the past tense prefixes with ⟨ə⟩, which reflects pronunciation, they have an underlying /a/ vowel in this place. This means that the vowel of the tense prefixes coalesces with a following /a/ to form a long vowel (see section 1.1.2), which is demonstrated in example (165b) below:

- (165) a. *Ang kəsilvay yes motonya.*  
 ang kə-silv=ay.Ø yes moton-ya  
 AT NPST-see=1SG.TOP 3SG.F.P store-LOC  
 ‘I’ve just seen her at the store.’  
 b. *Le mādruyāng ikan biratay.*  
 le mə-adru=yāng ikan biratay-Ø  
 PT.INAN PST-break=3SG.M.A wholly pot-TOP  
 ‘The pot, he completely broke it.’  
 c. *Vəmittang edaya.*  
 və-mit=tang edaya  
 RPST-live=3PL.M.A here  
 ‘They lived here (a long time ago)’

Note that the recent and the remote past tense are not generally marked if the past context is clear, for instance, when a past context has already been established in discourse. This may also happen explicitly by using a time adverbial such as *ḥəwɛnɛ*

*tamala* ‘yesterday’ or ၵၵ်းပီၵ်းပီၵ်း *pericanya menang pang* ‘a hundred years ago’. In the presence of an explicit time adverbial, redundant tense marking is also dropped subsequently:

- (166) *Ang kondayn kadanya terpasānley bihanya sarisa.*  
 ang kond=ayn.Ø kadanya terpasān-ley bihan-ya sarisa  
 AT eat=IPL.TOP together lunch-P.INAN week-LOC previous  
 ‘We had lunch together last week.’

The reference to a past time frame is explicitly given in this example by the adverbial phrase ၵၵ်းပီၵ်းပီၵ်း *bihanya sarisa* ‘last week’, hence the verb appears here simply as ၵၵ်း *kondayn*, rather than with redundant past-tense marking as ၵၵ်းမၵ်း *məkondayn*. Since past tense is often underspecified in Ayeri, the language also does not employ past forms in narrative contexts like English, among others, commonly does:

- (167) The sky above the port was the color of television, tuned to a dead channel.  
 (Gibson 1995 [1984]: 9)

This quote is, of course, the first sentence of Gibson (1995 [1984])’s novel *Neuromancer*, which never mentions any definite dates, but is clearly set in a future world, maybe somewhere in the latter half of the twenty-first century.<sup>37</sup> Yet, however, Gibson (1995 [1984]) recounts events which are logically happening in an imagined future as having already happened in the past: he uses the past tense as a convention of storytelling. What Ayeri, then, does in contrast to English is to basically treat stories as though happening in the present; adverbials referring to past time may, again, set up the correct time frame if required. Ayeri is in good company here, since according to Dahl (1985) “[m]ore common than marking narrative contexts [...] is not marking them—quite a considerable number of languages use unmarked verb forms in narrative contexts” (113). This, however, is yet different from a narrative present, that is, the use of present tense within a past context, which languages like English may use in narrative contexts to increase the feeling of immediacy and thus raise suspense. The following example from an Ayeri translation of the well-known Aesopian fable, ‘The North Wind and the Sun’ (compare International Phonetic Association 2007: 39), illustrates Ayeri’s non-marking of tense on verbs in narrative contexts:

<sup>37</sup> Christian (2017) reports that Gibson himself pictured his novel as set around 2035, though he has since realized that this cannot be right. One of the characters, the Finn, “makes an offhand reference to the ‘Act of ‘53’ as a law [which] deals with the citizenship status of artificial intelligences” (Christian 2017; also compare Gibson 1995 [1984]: 92)—this is very unlikely to refer to 1953.

- (168) *Ang manga ranyon adauyi Pintemis nay Perin, engyo*  
 ang manga ran-yon adauyi Ø Pintemis nay Ø Perin eng-yo  
 AT PROG argue-3PL.N then TOP North Wind and TOP Sun, be.more-3SG.N  
*mico sinyāng luga toya, lingya si lugaya asāyāng si*  
 mico sinyā-ang luga toya ling-ya si luga-ya asāya-ang si  
 strong who-A among 3PL.N.LOC, while-LOC REL pass-3SG.M traveler-A REL  
*sitang-naykonyāng kong tovaya mato.*  
 sitang-naykon=yāng kong tova-ya mato  
 self-wrap=3SG.M.A inside cloak-LOC warm.

‘The North Wind and the Sun were then arguing which among them is stronger, all the while a traveler passed by who had wrapped himself in a warm cloak.’

#### Future tense

Future tense marks explicit references to future time in Ayeri, that is, “someone’s plans, intentions or obligations” (Dahl 1985: 103), as well as predictions. The future prefixes behave analogously to the ones indicating past tense: *ṛ* *pə-* indicates immediate/near future (NFUT), *ṣ* *sə-* indicates impending future (FUT), and *ṣ̣* *ni-* indicates remote future (RFUT). Underlying the reduced vowels in *ṛ* *pə-* and *ṣ* *sə-* are /a/ and /e/, respectively, so that these prefixes cause adjacent vowels of the same type to lengthen as usual; the same, of course, applies to *ṣ̣* *ni-* regarding /i/. The following examples show the future tense markers in context:

- (169) a. *Pəsahayang!*  
 pə-saha=yāng  
 NFUT-come=1SG.A  
 ‘I’m coming (in a moment)!’  
 b. *Ang səkarsayn kankaya.*  
 ang sə-kars=ayn.Ø kanka-ya  
 AT FUT-freeze=1SG.TOP snow-LOC  
 ‘We will freeze in the snow.’  
 c. *Paronatang, nisa-sahaya dibakayāng.*  
 parona=tang ni-sa~saha-ya dihakaya-ang  
 believe=3PL.M.A RFUT-ITER~come-3SG.M prophet-A  
 ‘They believe that the prophet will return (one day).’

Like the past tense, the future is often not explicitly marked if the time frame is clear from context or has been clarified with such adverbials as *tasela* ‘tomorrow’, *mangasaba pericana* ‘in a year’, or *metay* ‘sometime’:

- (170) *Ang raypāy vāya bihanya mararya.*  
 ang raypa=ay.Ø vāya bihan-ya mararya  
 AT stop=ISG.TOP 2SG.LOC week-LOC next  
 ‘I’m stopping by you next week.’

It is possible here to explicitly mark the verb for future tense as well, for example, to make a promise, or to otherwise emphasize that the future condition will come to pass:

- (171) *Səsidejang tasela, diran.*  
 sə-sideg=yang tasela diran  
 FUT-repair=ISG.A tomorrow uncle  
 ‘I *will* repair it tomorrow, uncle.’

#### Past in past

So far, we have only dealt with tense marking from the point of view of the present. However, it is also possible to refer to an event which precedes another event in the past. Ayeri makes little use of auxiliary verbs, and thus the regular morphological and pragmatic means of tense marking have to cover this relation as well. In order to indicate pre-past events, it is customary to explicitly mark the verb for past time in Ayeri, in difference to the common lack of morphological marking for plain past tense. However, as it is possible for the *ə: mə-* prefix to be used to refer to ‘regular’ past events from a present point of view as well, context again has to provide the information that the frame of reference is past in this case, rather than the speaker’s present.

- (172) CONTEXT: Ajān’s past travels  
*Ya məsaraya iri maritay ang Ajān Tasankan*  
 ya ma-sara-ya iri maritay ang Ajān Ø Tasankan  
 LOCT PST-go-3SG.M already before A Ajān TOP Tasankan  
 ‘Tasankan, Ajān had already gone there before.’

The above example is essentially ambiguous as to the reference point. The explicit tense marking draws attention to the fact that the event definitely lies in the past and the adverbs underline this fact. Instead of reading the sentence as referring to a pre-past event, it is equally possible to read it from a present-time point of view as ‘Ajān has already gone to Tasankan before’, although under these circumstances, it would be more common to leave the *ə: mə-* out, as described in section 4.5.2:

(173) CONTEXT: Ajān's current traveling plans

*Ya saraya iri maritay ang Ajān Tasankan*  
 ya sara-ya iri maritay ang Ajān Ø Tasankan  
 LOCT go-3SG.M already before A Ajān TOP Tasankan

'Tasankan, Ajān already went there before.'

Likewise, it is possible to make plans in the past with the intention of them coming to fruition only later, possibly at a point before the current time or even further in the future. The English idiom to express this time relation is 'was going to'; in Ayeri, the relation cannot be expressed by morphological means, but only by lexical ones. Thus, 𑌂𑌃 *no-* 'want; plan to' must be used, together with explicit past marking. Since 𑌂𑌃 *no-* is a modal particle (see section 4.5.5), inflection is placed on the content verb.

(174) CONTEXT: Ajān's having gone to Tasankan

*Ang no m̄ainca tosanangyeley hiro yam Pila.*  
 ang no ma-int=ya tosang-ye-ley hiro yam Pila  
 AT want PST-buy=3SG.M.TOP earring-PL-P.INAN new DAT Pila

'He had planned to buy new earrings for Pila.'

The time relation expressed here is, thus, essentially that of a pre-past event again, since the planning of the action of buying took place before the time of going to Tasankan.

#### *Past in future*

Of course, it is also possible to refer to future actions or events which will already have happened before a point further in the future. From the point of view of the later event, the closer event will thus already lie in the past, forming its prerequisite. As with future-in-past, there is no way in Ayeri to mark this relation morphologically, but lexical means have to be used, that is, first and foremost the adverb 𑌂𑌃 *iri* 'already', which indicates that an action has been completed in the past. As with other future actions, the time frame must be inferred from context if it is not indicated explicitly by temporal adverbs or future-tense marking (compare section 4.5.2).

(175) CONTEXT: Ajān's traveling to Tasankan

*Ang girenja iri nilay sirutayya tamala pesan.*  
 ang girend=ya.Ø iri nilay sirutay-ya tamala pesan  
 AT arrive=3SG.M.TOP already probably evening-LOC tomorrow before

'He will probably already (have) arrive(d) before tomorrow evening.'

Strictly speaking, the above example does not make it explicit whether Ajān *will arrive* before evening or *will have arrived*. In order to indicate that the action is all but complete, the cessative adverb 𐎠𐎢𐎡𐎴 *mayisa* ‘be done; ready’ may be added:

- (176) *Girenjāng      mayisa    iri.*  
 girend=yāng    mayisa    iri  
 arrive=3SG.M.A   be.done   already

‘He already has arrived’, or: ‘He will already have arrived.’

### 4.5.3 Aspect

Aspectually unmarked verb forms indicate general statements, which may be completed or ongoing, depending on the meaning of the verb itself. Ayeri seems not to make strict formal distinctions with regards to either, perfectivity or lexical aspect. It needs to be noted, however, that at least to date, it is not entirely clear how Ayeri fares with regards to conceptualizing perfectivity, which Dahl (1985: 76) in reference to Comrie (1976: 16) characterizes as being based on the conceptualization of actions or events as bounded or otherwise limited wholes, versus a lack of closure. Dahl (1985) also notes that “it seems rather to be a typical situation that even in individual languages, we cannot choose one member of the opposition [perfective–imperfective] as being clearly unmarked” (69). He further argues that

The difficulty of deciding which member of the opposition is marked and which is unmarked is connected with the tendency for PFV:IPFV to be realized not by affixation or by periphrastic constructions but rather by less straightforward morphological processes. (73)

In other words: it *is* a difficult category to assess, in spite of being “often taken to be ‘the’ category of aspect” (69), mostly since languages often do not realize it by straightforward means. In Ayeri, the most tangible way of expressing completeness of an action is to use adverbs like 𐎠𐎢𐎡𐎴 *mayisa* ‘ready, done’, 𐎠𐎢𐎡𐎴 *iri* ‘already’, 𐎠𐎢𐎡𐎴 *ikan* ‘completely, wholly’ (also as an adjective); a quantifier like 𐎠𐎢𐎡𐎴 *-hen* ‘all’; verbs like 𐎠𐎢𐎡𐎴 *samir-* ‘finish’, 𐎠𐎢𐎡𐎴 *panga-* ‘end’, and 𐎠𐎢𐎡𐎴 *raypa-* ‘stop’; or an indefinite pronoun like 𐎠𐎢𐎡𐎴 *enya* ‘everything, everybody’:

- (177) *Le           kondjeng    enya.*  
 le           kond=yeng    enya-Ø  
 PT.INAN   eat=3SG.F.A   everything

‘She ate everything.’ or: ‘She ate it all up.’

Apart from the more general dilemma of determining how perfectivity is expressed in detail, Ayeri marks verbs openly by morphological means to indicate

progressive, habitual, and iterative actions—by their nature all conceptualizing actions as being composed of a series of two or more related actions of the same kind, though not necessarily implying a strong semantic connection to the past. The following sections will discuss each of these categories.

### Progressive

In order to indicate an ongoing action explicitly, Ayeri employs the marker *ang* *manga*, which we have already seen with directional prepositions above (section 4.4.1). This marker is a clitic within the verb phrase and precedes the verb word:

- (178) *Ang manga ilye karonas nakajyam.*  
 ang manga il=ye.Ø karon-as naka-ye-yam  
 AT PROG give=3SG.F.TOP water-P plant-PL-DAT  
 ‘She is giving water to the plants.’

Going by the data presented by Dahl (1985: 91), Ayeri is typologically unremarkable in marking progressive aspect with a periphrastic construction, although it is remarkable in possessing morphological progressive marking at all—it only occurs in 27% of the languages in Dahl (1985)’s sample. Typical of progressives, this form of the verb is not limited to present contexts in Ayeri as exemplified in (178) above. Instead, it is possible to also use the progressive in past (179a) and future (179b) contexts, the latter being probably less typical, though:

- (179) a. *Ang manga gumya Ajān tadayya si ya kongaye ang Pila*  
 ang manga gum-ya Ø Ajān taday-ya si ya konga-ye ang Pila  
 AT PROG work-3SG TOP Ajān time-LOC REL LOCT enter-3SG.F A Pila  
*gumanga tamala.*  
 gumanga-Ø tamala  
 workshop-TOP yesterday  
 ‘Ajān was working when Pila entered the workshop yesterday.’  
 b. *Ang manga nimpay rangya nā tadayya si cunyo bekalang*  
 ang manga nimp=ay.Ø rang-ya nā taday-ya si cun-yo bekal-ang  
 AT PROG run=1SG.TOP home-LOC 1SG.GEN time-LOC REL begin-3SG.N festival-A  
*tasela.*  
 tasela  
 tomorrow  
 ‘I will be running home when when the festival starts tomorrow.’

Ignoring the constructedness of the above examples, the time adverb is located in the relative clause in both sentences in this case. For illustrative purposes, let us assume that a narrative context with the respective time frames has already been

established in (179). As noted above, Ayeri prefers to not mark every verb for tense explicitly when the context is clear already, insofar the argument that progressive aspect works independent of *tense* needs corroboration; the question being whether constructions like  $\text{māṅ} \text{ m} \text{---}$  *māṅ m*... (PROG PST-...) are possible. Strictly speaking, there is nothing to prevent this construction, however, we have to wonder if it is actually *natural* to phrase things this way. What can be said at least is that progressive marking is possible within a context referring to past or future actions and events irrespective of their explicit marking on the verb. Furthermore, the examples in (179) illustrate a very typical use of the progressive as a structuring means, that is, an ongoing background action may be expressed using a progressive form, while an interrupting action receives no special marking (compare the past progressive in English).

#### Habitual

Unlike the few instances of habitual marking in Dahl (1985)'s survey (96), Ayeri possesses a suffix for marking habitual actions on the verb:  $\text{asa}$  *-asa*, where the first *-a* replaces the terminal vowel of a verb stem if present, compare example (180b) below. The habitual aspect in Ayeri stresses that an action is carried out as a habit, that is, not just a few times, but with regular frequency. Essentially, verbs marked with the habitual in Ayeri can be translated by adding the adverb *usually* in English (97). The habitual aspect is not restricted to present actions or absolute statements like the one in (180a), but can also be used in past contexts to express that something *used to* be done in the past as in (180b). While the contexts are probably very few, there are no restrictions about using the habitual also in contexts relating to future actions which are predicted to be carried out habitually. The following sentences illustrate typical contexts in which the habitual may be used:

- (180) a. *Le kondasayāṅ bemaṃe pruyya nay napayya kayvay.*  
 le kond-asa=yāṅ hema-ye-Ø pruy-ya nay napay-ya kayvay  
 PT.INAN eat-HAB=3SG.M.A egg-PL-TOP salt-LOC and pepper-LOC without  
 'He always eats his eggs without salt and pepper.'
- b. *Ang ajasāyn ranisungas tadayya si yāṅ ganas.*  
 ang aja-asa=ayn.Ø ranisung-as taday-ya si yāṅ gan-as  
 AT play-HAB=1PL.TOP hide.and.seek-P time-LOC REL 1SG.A child-P  
 'We used to play hide-and-seek when I was a child.'

Importantly, the verb root with habitual marking forms a new verb stem to which affixes may be attached. This is relevant to mood suffixes, which follow aspectual marking.

*Iterative*

The iterative aspect marks actions that are repeated at least once by reduplication. The equivalent in English is to use the adverb *again* or the prefix *re-*. Iterative reduplication in Ayeri is only partial, in that only the initial CV- or VC- of a verb root is repeated—there are no verb roots which consist of only a single consonant or vowel. Complications begin, however, if the verb root starts with a consonant cluster (not unusual), or a diphthong (rare). In the case of an initial consonant cluster, the cluster is simplified to only include the first consonant; for initial diphthongs, there is no necessity to include the first available consonant, since the secondary vowel of a diphthong can by itself act as a semivowel to make up for the vowel hiatus.

- (181) a.  $\text{ꨀꨣꨳꨳꨳ}$ : *kuta-* ‘thank’ →  $\text{ꨀꨣꨳꨳꨳꨀꨣꨳꨳꨳ}$ : *ku-kuta-* ‘thank again’  
 b.  $\text{ꨀꨣꨳꨳꨳꨳ}$ : *amang-* ‘happen’ →  $\text{ꨀꨣꨳꨳꨳꨳꨀꨣꨳꨳꨳꨳ}$ : *am-amang-* ‘happen again’  
 c.  $\text{ꨀꨣꨳꨳꨳꨳꨳ}$ : *prant-* ‘ask’ →  $\text{ꨀꨣꨳꨳꨳꨳꨳꨀꨣꨳꨳꨳꨳꨳ}$ : *pa-prant-* ‘ask again’  
 d.  $\text{ꨀꨣꨳꨳꨳꨳꨳꨳꨳ}$ : *ayrin-* ‘set’ →  $\text{ꨀꨣꨳꨳꨳꨳꨳꨳꨳꨀꨣꨳꨳꨳꨳꨳꨳꨳꨳꨳ}$ : *ay-ayrin-* ‘set again’

The reduplicated stem works as a new stem for other prefixes, that is, no morphological material can go between the reduplicated part and the lexical stem proper; the following example also shows that there is, again, no restriction on the iterative aspect with regards to tense:

- (182) *Məku-kutayāng.*                      (\**Ku-məkutayāng*)  
 mə-ku~kuta=yāng  
 PST-ITER~thank=3SG.M.A  
 ‘He thanked again.’

Iterative reduplication is lexicalized at least in one verb,  $\text{ꨀꨣꨳꨳꨳꨳꨳ}$ : *sa-saha-* ‘return’. Besides the meaning of ‘again’, iterative reduplication may also indicate the meaning ‘back’, for instance in the following example:

- (183) *Ta-tapyu      adaley!*  
 ta~tapy-u      ada-ley  
 ITER~put-IMP    that-P.INAN  
 ‘Put that back!’

In addition to a simple iterative meaning, a frequentative meaning like ‘walk around’, ‘cry all the time’, or ‘keep asking’ can be achieved by combining the iterative and progressive aspects, that is, the verb is both modified by  $\text{ꨀꨣꨳꨳꨳꨳꨳ}$  *manga* for progressive aspect and partial initial reduplication for iterative aspect:

- (184) a. *Ang manga la-lampay saba-sara manga luga babisya-ben.*  
ang manga la~lamp=ay.Ø saha-sara manga luga bahis-ya=hen  
AT PROG ITER~walk=ISG.TOP back.and.forth DIR while day-LOC=all  
‘I was walking around back and forth all day long.’
- b. *Ang manga si-sipye kimay sirutayya.*  
ang manga si~sip-ye kimay.Ø sirutay-ya  
AT PROG ITER~cry-3SG.F baby.TOP night-LOC  
‘The baby, she is crying all the time at night.’
- c. *Manga pa-prantu!*  
manga pa~prant-u  
PROG ITER~ask-IMP  
‘Keep asking!’

#### Lexically marked aspectual categories

Besides using morphological means, Ayeri expresses some aspectual categories by way of lexical items, that is, verbs and adverbs. The relevant words in this respect are the adverbs *sirimang* ‘about to’ (prospective) and *mayisa* ‘ready; be done’ (cessative), as well as the verb *cun-* ‘begin, start’ (inchoative):

- (185) *Saratang sirimang.*  
sara=tang sirimang  
leave=3PL.M.A about.to  
‘They are about to leave.’
- (186) *Konjang mayisa.*  
kond=yang mayisa  
eat=ISG.A be.done  
‘I am done eating.’
- (187) *Pəcunreng seyaryam.*  
pə-cun=reng seyar-yam  
NFUT-begin=3SG.INAN.A rain-PTCP  
‘It is going to start raining any moment.’

Prospective *sirimang* (185) and cessative *mayisa* (186) are expressed by adverbs which are regularly following verbs as their heads. They precede other adverbs due to a higher amount of semantic bondedness, by tendency, than other descriptive adverbs. For this reason, as well as for expressing a grammatical function rather than lexical meaning with the original meaning still transparent, they appear

to be on the verge of grammaticalization. In contrast, the verb inchoative  $\text{ᄃᆞᆫ}$  *cun-* (187) is part of a periphrastic verb construction, that is,  $\text{ᄃᆞᆫ}$  *cun-* requires a content-verb VP as a complement rather than an NP. The content/main verb appears in a non-finite form marked by  $\text{ᄃᆞᆫ}$  *-yam*, which will be described below.

#### 4.5.4 Mood

Besides various aspects, Ayeri also marks mood other than realis: irrealis, imperative, hortative, and negative. These are expressed by suffixes on the verb and typically follow aspectual marking where it is expressed by a suffix, that is, the habitative suffix  $\text{ᄃᆞᆫ}$  *-asa*. The following subsections will discuss each of the modal categories expressed by suffixes; modals proper will be discussed in section 4.5.5.

##### *Irrealis*

Irrealis marking in Ayeri is indicated by the suffix  $\text{ᄃᆞᆫ}$  *-ong* and marks that an action is thought of as hypothetical by the speaker, whether he or she expects it to be fulfilled or not:

- (188) *Sabongvāng edaya, ming silvongvāng sitang-vāri.*  
 saha-ong=vāng edaya ming silv-ong=vāng sitang=vāri  
 come-IRR=2SG.A here can see-IRR=2SG.A REFL=2SG.INS

‘If you came/had come here, you could see/have seen it yourself.’

As (188) shows, irrealis marking is especially prominent in conditional clauses which express a hypothetical cause and effect. Both condition/protasis and consequence/apodosis are marked with the irrealis suffix in this case. The example sentence also shows that, again, the initial vowel of the suffix replaces the last vowel of the verb stem, if there is one, so that  $\text{ᄃᆞᆫ}$  *saha-* becomes  $\text{ᄃᆞᆫ}$  *sabong-*, to which further mood suffixes may be added, and finally, person marking.

The same suffix,  $\text{ᄃᆞᆫ}$  *-ong*, is also used in other contexts expressing inactual events, for instance, in reported speech, or complement clauses expressing a wish about the actualization of a hypothetical event:

- (189) *Narayeng, ang menongye demās yena.*  
 nara=yeng ang menu-ong=ye.Ø dema-as yena  
 say=3SG.F.A AT visit-IRR=3SG.F.TOP aunt-P 3SG.F.GEN

‘She said she were visiting her aunt.’

- (190) *Hanuyang, koronongyang maritay.*  
 hanu=yang koron-ong=yang maritay  
 wish=1SG.A know-IRR=1SG.A before

‘I wish I had known this before.’

Irrealis marking does not, however, appear in contexts that express requirements on or wishes about a third person's actions, that is, typical subjunctive contexts; the verb in the complement clause rather appears in the indicative in these contexts. To add a sense of expectation of compliance about the action, the modal *ḡ mya* 'be supposed to' may be added, see section 4.5.5.

- (191) a. \**Arapnang, sa garongyāng hatay.*  
           arap=nang sa gara-ong=yāng hatay-Ø  
           require=IPL.A PT call-IRR=3SG.M.A police-TOP
- b. *Arapnang, sa (mya) garayāng hatay.*  
           arap=nang sa (mya) gara=yāng hatay-Ø  
           require=IPL.A PT (be.supposed.to) call=3SG.M.A police-TOP
- 'We require that he call the police.'

### Negative

The negative mood is used to negate verbs, which is separate from irrealis marking: negation of verbs is marked by the suffix *-oy*, which has an allomorph *-u* before diphthongs in romanization and also in pronunciation. The Tahano Hikamu spelling is more conservative here and keeps the spelling *-oyay* for */-uay/* (-NEG=ISG.TOP). Like the irrealis suffix, the negative suffix deletes the last vowel of the verb stem if present, which is exemplified in (192b) besides this example showing the *-u* allomorph. Moreover, example (192c) shows that negative marking usually follows irrealis marking when suffixes are stacked: *-ong + -oy → -ongoy*.

- (192) a. *Ang silvoyyan nasiyamanas tan.*  
           ang silv-oy=yan.Ø nasi-yam-an-as tan  
           AT see-NEG=3PL.M.TOP approach-PTCP-NMLZ-P 3PL.M.GEN
- 'They did not see them approaching.'
- b. *Ang peguay kalam adaley!*  
           ang pega-oy=ay.Ø kalam ada-ley  
           AT steal-NEG=ISG.TOP honestly that-P.INAN
- 'I didn't steal it, honestly!'
- c. *Ang tendongoyva sarayam adaya.*  
           ang tend-ong-oy=va.Ø sara-yam adaya  
           AT dare-IRR-NEG=2SG.TOP go-PTCP there
- 'You would not dare to go there.'

If negated verbs appear together with negative indefinite pronouns (compare section 4.2.4), multiple negatives do not cancel each other out, but amplify the

negation instead. This is to say that Ayeri allows for multiple negation as a means to emphasize the impossibility of something.

- (193) *Le gamaroyya tadoy ranyāng adanya.*  
 le gamar-oy-ya tadoy ranyāng adanya-Ø  
 PT.INAN manage-NEG-3SG.M never nobody-A that-TOP

‘Nobody ever managed that’,  
 literally: ‘Nobody never didn’t manage that.’

### Imperative

The imperative mood is used to mark orders to an unspecified second person, that is, imperative verbs do not require an overt second person agent; if an addressee is included, it is oblique and unmarked for case, see section 4.1.3. Moreover, no distinction is made between singular and plural second-person addressees, so that the marker is 𐌸 -u in either case. Like the other mood suffixes, the vowel of the imperative suffix replaces the vowel of the verb stem if there is one.

- (194) a. *Giru māy!*  
 gira-u māy  
 hurry-IMP INT  
 ‘Hurry up!’
- b. *Tangu yām, Yan!*  
 tang-u yām Yan  
 listen-IMP 1SG.DAT Yan  
 ‘Listen to me, Yan!’
- c. *Tangu yām, ledanye nā!*  
 tang-u yām ledan-ye nā  
 listen-IMP 1SG.DAT friend 1SG.GEN  
 ‘Listen to me, my friends!’

It is important to note that imperative-marked verbs behave essentially as infinitive forms in that they do not exhibit any agreement in person, number, gender, and topic, and also cannot act as hosts for clitic personal pronouns. Imperative verbs may be marked for negative and hortative, however. Hence, for instance, (195) is grammatical, while the examples in (196) are not.

- (195) *Saroyu yas!*  
 sara-oy-u yas  
 leave-NEG-IMP 1SG.P  
 ‘Don’t leave me!’

- (196) a. \**Ya sa-sabu nanga!*  
           ya sa~saha-u nanga-Ø  
           LOCT ITER~go-IMP house-TOP  
           ‘Go back to the house!’
- b. \**Sa sutamuya kohanya tasela!*  
      sa sutam-u=ya.Ø kohan-ya tasela  
      PT hang-IMP=3SG.M.TOP sunrise-LOC tomorrow  
      ‘May he be hanged tomorrow at sunrise!’

Example (195) simply expresses a negative command, which is unproblematic in terms of logic, since commands may be issued to act in a certain way, or to forgo this action. Example (196a) shows the imperative verb as preceded by a locative topic marker, which is not logically impossible, but unacceptable by convention.<sup>38</sup> Example (196b) takes this one step further in displaying a cliticized object pronoun in the fashion of morphological passives (compare section 4.5.1, page 186).

#### *Hortative*

The hortative is a special kind of imperative which addresses a group including the speaker. Its implied referent is thus first-person plural. Again, it is not necessary to mark the verb for the addressee here. As the hortative is related in meaning to the imperative, the verb also uses the imperative inflection with *-u*, but it is fully reduplicated in addition to mark the difference. As regards agreement morphology, the same restrictions as those of imperatives apply.

- (197) a. *Sabu!*  
           saha-u  
           go-IMP  
           ‘Go!’
- b. *Sabu-sabu umangya!*  
      sahu~saha-u umang-ya  
      HORT~go-IMP beach-LOC  
      ‘Let’s go to the beach!’

#### 4.5.5 Modals

Modals in Ayeri express the notions of ability, desire, permission, requirement, obligation, and also of continuation, as indicated by Table 4.24. They can gener-

<sup>38</sup> The translation of ‘Ozymandias’ in section B.3 deviates from this rule in the line *sa silvu gumo nā* ‘my works, regard them’. This is poetic license, however.

Table 4.24: Modal verbs and particles

Category	Verb	Particle	Translation
ABILITY	မိာ်: <i>ming-</i>	မိာ် <i>ming</i>	‘be able to, can’
DESIRE, INTENTION	ၵံး: <i>vac-</i>	ၵံး <i>vaca</i>	‘like to’
	ၵံး: <i>no-</i>	ၵံး <i>no</i>	‘want to’
PERMISSION	ခိာ်: <i>kila-</i>	ခိာ် <i>kila</i>	‘be allowed to, may’
REQUIREMENT	ခိာ်: <i>ilta-</i>	ခိာ် <i>ilta</i>	‘need to’
OBLIGATION	မုး: <i>mya-</i>	မုး <i>mya</i>	‘be supposed to, shall’
	မုး: <i>rua-</i>	မုး <i>rua</i>	‘have to, must’
CONTINUATION	မုး: <i>div-</i>	မုး <i>diva</i>	‘stay, remain’

ally act as both fully inflectable intransitive verbs, as well as clitics which occur in combination with fully inflected content verbs:

- (198) a. *Rua babavāng babo, ang bihanoyya mirampaluy nas.*  
 rua baha=vāng baho ang bihan-oy=ya.Ø mirampaluy nas  
 must shout=2SG.A loudly AT understand-NEG=3SG.M.TOP otherwise IPL.P  
 ‘You have to shout loudly, otherwise he does not understand us.’
- b. *Ruasanang.*  
 rua-asa=nang  
 must-HAB=IPL.A  
 ‘We usually have to.’

As (198a) shows, the modal does not inflect in combination with another verb; as a clitic it rather acts similarly to a prefix, like the progressive marker မိာ် *manga*, which is also presumably deverbal (compare section 3.1, footnote 3). In difference to မိာ် *manga*, which as a preverbal element only serves a grammatical function, the semantic component of the modals is still prevalent, as is shown by (198b), where မုး *rua-* appears in its function as an intransitive verb with the same meaning of strong obligation as in (198a), though it carries regular person and aspect inflection here. Inflecting the modal in the context of cooccurrence with a content verb is, however, considered unacceptable:

- (199) \**Ruavāng babayam babo.*  
 rua=vāng baha-yam baho  
 must=2SG.AT shout-PTCP loudly  
 ‘You have to shout loudly.’

Regarding example (198b) and its ability to inflect, Ayeri also has a verb that generally means ‘do’, namely,  $\text{mir}$ : *mira-*. However, it is not common to use this as a dummy verb to carry the inflection instead of the modal verb either. While such a construction is not ungrammatical *per se*, it is simply not the preferred way to express intransitive modal verbs:

- (200)  $\text{?Rua mirasanang}$ .  
            $\text{rua mira-asa=nang}$   
           must do-HAB=IPL.A  
           ‘We usually have to.’

While most of the verbs listed in Table 4.24 should look reasonable to English speakers, Ayeri uses two verbs for modal particles which may seem odd:  $\text{vac}$  *vaca* ‘like to’, to express taking pleasure in doing something, and  $\text{div}$  *diva* ‘stay, remain’, to express that the action is being prolonged.<sup>39</sup> The latter verb thus also has an aspectual component to its meaning.

- (201) a.  $\text{Ang vacay betayley}$ .  
            $\text{ang vac=ay.}\emptyset$  betay-ley  
           AT like=ISG.TOP berry-P.INAN  
           ‘I like berries.’  
       b.  $\text{Ang vaca konday betayley}$ .  
            $\text{ang vaca kond=ay.}\emptyset$  betay-ley  
           AT like eat=ISG.TOP berry-P.INAN  
           ‘I like to eat berries.’
- (202) a.  $\text{Ang divay rangya nā tasela}$ .  
            $\text{ang div=ay.}\emptyset$  rang-ya nā tasela  
           AT stay=ISG.TOP home-LOC ISG.GEN  
           ‘I will stay home tomorrow.’  
       b.  $\text{Ang diva bengya ku-danyās kebay}$ .  
            $\text{ang diva beng=ya.}\emptyset$  ku=danya-as kebay  
           AT stay stand=3SG.M.TOP like=one-P alone  
           ‘He remained standing as the only one.’

The fact that modal particles in Ayeri retain their verbal semantics in spite of shedding verb morphology is probably even more obvious from the above examples (201) and (202), which show the alternation between full-verb use (a) and modal use

<sup>39</sup> The verb stems indeed end in a consonant while the modal particles need an epenthetic *-a* to form permissible words.

(b) for both ᳚᳚᳚: *vac-* and ᳚᳚᳚: *div-*. In comparison to the other modals in Table 4.24, these two verbs in particular also stand out by virtue of their roots ending in a consonant instead of a vowel like in the other cases. This suggests that they may have been grammaticalized as modals only relatively recently, and there appears to be variation at least for ᳚᳚᳚: *vac-*, for instance:

- (203) ... *yam vacongyang ilisayam eda-koyās gan* ...  
 ... *yam vac-ong-yang ilisa-yam eda=koya-as gan-Ø* ...  
 DATT like-IRR-1SG.A dedicate-PTCP this=book-P child-TOP

‘... I would like to dedicate this book to the child ...’ (Becker 2015 [2013]: 1, 8)

Moreover, as illustrated previously in (191b), ᳚᳚᳚ *mya* ‘be supposed to, shall’ can be used to express indirect commands where English may use the subjunctive mood; essentially the function of this modal is that of the jussive mood. For convenience, the above example will be repeated here:

- (204) *Arapnang, sa (mya) garayāng hatay.*  
*arap=nang sa (mya) gara=yāng hatay-Ø*  
 require=1PL.A PT (be.supposed.to) call=3SG.M.A police-TOP

‘We require that he call the police.’

In addition to this use, ᳚᳚᳚ *mya* is also used in commands to third persons, whether direct or indirect. English may use *shall* here as an equivalent.

- (205) a. *Ningu cam, mya saratang.*  
*ning-u cam mya sara=tang*  
 tell-IMP 3PL.M.DAT shall leave=3PL.M.A  
 ‘Tell them to leave.’  
 b. *Mya vehara nekanley.*  
*mya veh-ara nekan-ley*  
 shall build-3SG.INAN bridge-P.INAN  
 ‘A bridge shall be built.’  
 c. *Mya yomāra makangreng.*  
*mya yoma-ara makang-reng*  
 shall exist-3SG.INAN light-A.INAN  
 ‘Let there be light.’

#### 4.5.6 Participle

Besides the imperative—and, by extension, the hortative—Ayeri also possesses another infinite form called the participle. This form is marked by appending ᳚᳚᳚

-yam to the verb root. The participle is generally the form of verbal complements of intransitive subordinating verbs other than modal verbs (compare section 4.5.5). For instance,  $\text{ṣṣṣ}$  *cun-* ‘begin’ or  $\text{ṣṣṣ}$  *manang-* ‘avoid’ both allow complementation with another verb:

- (206) a. *Cunyo makayam perinang.*  
 cun-yo maka-yam perin-ang  
 begin-3SG.N shine-PTCP sun-A  
 ‘The sun began to shine.’
- b. *Manangyeng pengalyam badanas saba yena.*  
 manang=yeng pengal-yam badan-as saha yena  
 avoid=3SG.F.A meet-PTCP father-P in.law 3SG.F.GEN  
 ‘She avoids to meet her father-in-law.’

Since subordinated verbs may be transitive like in (206b), the problem of center-embedding arises when the agent NP of the subordinating verb is not simply a cliticized pronoun (see section 3.2.5, p. 89; 4.5.1), since arguments of the subordinating verb follow the embedded clause as in (206a):

- (207) a.  $\text{ṣṣṣ}$  *Ang pinyaya [konjam inunas] Yan sa Pila.*  
 ang pinya-ya kond-yam inun-as Ø Yan sa Pila  
 AT ask-3SG.M eat-PTCP fish-P TOP Yan P Pila  
 ‘Yan asks Pila to eat the fish.’
- b.  $\text{ṣṣṣ}$  *Ang pinyaya [ilyam koyaley ledanyam yana] Yan sa Pila.*  
 ang pinya-ya il-yam koya-ley ledan-yam yana Ø Yan sa Pila  
 AT ask-3SG.M give-PTCP book-P.INAN friend-DAT 3SG.M.GEN TOP Yan P Pila  
 ‘Yan asks Pila to give the book to his friend.’

In order to avoid too much complexity at the expense of ease of composition on the speaker’s side, and intelligibility on the listener’s, it is much preferable to express the embedded clause as a complement clause instead.<sup>40</sup> The particle  $\text{ṣṣṣ}$  *da-* may be

<sup>40</sup> The German linguist Otto Behaghel (1854–1936) coined a number of laws—albeit with German in focus—three of which are relevant to information flow: “Das oberste Gesetz ist dieses, daß das geistig eng Zusammengehörige auch eng zusammengestellt wird.” (Behaghel 1932: 4) [‘The supreme law is such that the mentally closely related is also arranged in close proximity.’]—“Ein zweites machtvolleres Gesetz verlangt, daß das Wichtigere später steht als das Unwichtige, dasjenige, was zuletzt noch im Ohr klingen soll.” (4) [‘A second powerful law demands that more important information appear at a later point than what is less important: the which is supposed lastly to resonate in the listener’s ear.’]—“Gesetz der wachsenden Glieder [...]; es besagt, daß von zwei Gliedern, soweit möglich, das kürzere vorausgeht, das längere nachsteht.” (6) [‘Law of the growing constituents [...]; it signifies that of two con-

added to the formerly subordinating verb in order to signal that a complement clause is following.

- (208) a. *Ang da-pinyaya Yan sa Pila, [le konjeng inun].*  
 ang da=pinya-ya Ø Yan sa Pila le kond=yeng inun-Ø  
 AT such=ask-3SG.M TOP Yan P Pila PT.INAN eat=3SG.F.A fish-TOP  
 ‘Yan asks Pila to eat the fish.’
- b. *Ang da-pinyaya Yan sa Pila, [le ilyeng koya ledanyam yana].*  
 ang da=pinya-ya Ø Yan sa Pila le il=yeng koya-Ø ledan-yam  
 AT such=ask-3SG.M TOP Yan P Pila PT.INAN give-3SG.F book-TOP friend-DAT  
 yana  
 3SG.M.GEN  
 ‘Yan asks Pila to give the book to his friend.’

#### 4.5.7 Other affixes

In the section on noun morphology we have already encountered a number of clitic prefixes that may attach to noun heads (see section 3.2.5, section 4.1.4), and some of these can also attach to verbs. Furthermore, verbs may also be modified by certain adverbial quantifier clitics. The latter are dealt with in more detail in the section on adverbs; only a few relevant examples will be given here.

##### Prefixes

We have already encountered the prefix 𑀅: *da-* ‘so, such’ in the previous section, as well as in the section on noun prefixes (see section 3.2.5, p. 81; 4.1.4; 4.5.6). With nouns, 𑀅: *da-* ‘such’ patterns as a demonstrative with the deictic prefixes 𑀅: *eda-* ‘this’ and 𑀅: *ada-* ‘that’. Distinguishing between near and far is not possible with verbs,<sup>41</sup> but pointing out that something is happening ‘in this way’, ‘so’ is still possible, hence 𑀅: *da-* is also applicable to verbs. 𑀅: *da-* can thus act essentially as a pro-verb. As a clitic, it leans on the verb, preceding all other inflectional prefixes, that is, any tense prefixes that may possibly precede the verb root.

stituents, if possible, the shorter one precedes, the longer one follows.’] Also compare Wasow (1997) on the cooperation between speaker and listener in the face of syntactically complex, ‘heavy’ constituents.

<sup>41</sup> Unless you distinguish between actions performed in the speaker’s proximity versus ones that are performed at a distance. Ayeri, however, does not make such a distinction.

- (209) a. *Da-mingya ang Diyan.*  
 da=ming-ya ang Diyan.  
 so=can-3SG.M A Diyan  
 ‘Diyan can (do it).’
- b. *Ang da-məpinyaya Yan sa Pila.*  
 ang da=mə-pinya-ya Ø Yan sa Pila  
 AT such=PST-ask-3SG.M TOP Yan P Pila  
 ‘Yan asked Pila to (do so).’

Another possible use of the prefix 𐄢: *da-* with verbs is related to the colloquial abbreviation of 𐄢𐄣𐄤 *danya* ‘such one’ as described in sections section 3.2.5 (p. 78) and section 4.2.2, where the demonstrative part, 𐄢: *da-* may be split off the pronoun and attached in front of the adjective directly to express ‘the ADJ one’. This practice has possibly been extended to verbs in analogy to the use just illustrated in (209). Example (102) from the mentioned section is repeated here for the reader’s convenience:

- (210) *Sa noyang da-tuvo.*  
 sa no=yang da=tuvo.Ø  
 PT want=1SG.A such=red.TOP  
 ‘I want the red one.’

When 𐄢: *da-* is used as an abbreviation for 𐄢𐄣𐄤𐄥 *danyās* (such.one-P) or 𐄢𐄣𐄤𐄥𐄦 *danyaley* (such.one-P.INAN), as in the following example, it may also appear prefixed to the verb:

- (211) *Mya da-vehoyyāng.*  
 mya da=veh-oy=yāng  
 supposed.to one=build-NEG=3SG.M  
 ‘He is not supposed to build one.’

As mentioned above, 𐄢: *da-* can also be used in an expletive way, to express ‘in this way’ or ‘like that’. It does not encode an anaphoric relation in this case, but merely serves as a discourse particle to highlight the action.

- (212) a. *Da-sabāra seyaneng.*  
 da=saha-ara seyan-eng  
 thus=come-3SG.INAN rain-A.INAN  
 ‘Here comes the rain.’
- b. *Le no da-subroyya ang Hasanjan tiga kaytan yana.*  
 le no da=subr-oy-ya ang Hasanjan tiga kaytan-Ø yana  
 PT want there=give.up-NEG-3SG.M A Hasanjan honorable right-TOP 3SG.M.GEN  
 ‘Mr. Hasanjan did not want to cease his right just there.’

Besides  $\text{da-}$ , verbs may also take the  $\text{ku-}$  ‘like’ prefix, which we have already seen with both nouns and adjectives (compare section 3.2.5, 4.1.4, 4.3.4). The English translation in context may rather be ‘as though’ than ‘like’ here, but the function is the same: expressing likeness and resemblance.

- (213) *Misyeng, ang ku-tangoyye yās.*  
 mis=yeng ang ku=tang-oy=ye.Ø yās  
 act=3SG.F.A AT like=hear-NEG=3SG.F.TOP 3SG.M.P

‘She acts as though she does not hear him.’

As previously described (compare section 3.2.5, p. 80, and 4.2.6),  $\text{sitang}$  ‘self’, the reflexive clitic, can appear as a prefix on verbs as well. This may be the case when the patient/undergoer of a transitive sentence signifies the same entity as the actor. Example (118) is repeated here for convenience:

- (214) *Ang sitang-silvye puluyya.*  
 ang sitang=silv=ye.Ø puluy-ya  
 AT self=see=3SG.F.TOP mirror-LOC

‘She sees herself in the mirror.’

The image of the agent in the mirror is that of the agent herself, so she is seeing her own reflection. Both agent and patient thus reference the same person, which means that instead of using the reflexive object pronoun  $\text{sitang-yes}$  ‘herself’ (self-3SG.F.P), it is possible to drop the pronoun and to place the reflexive prefix on the verb instead.

### Suffixes

Besides taking clitic prefixes, verbs may also take clitic suffixes, namely, adverbial suffixes denoting degree, such as  $\text{-ani}$  ‘not at all’,  $\text{-eng}$  ‘rather’,  $\text{-ikan}$  ‘much’,  $\text{-ikoy}$  ‘not much’,  $\text{-kay}$  ‘a little’,  $\text{-nama}$  ‘just, only, merely’,  $\text{-ngas}$  ‘almost’, and  $\text{-nyama}$  ‘even’ (see section 3.2.5, p. 94). Some of these overlap with quantifiers applicable to nouns, and all of them are also applicable to adjectives. As enclitics, these suffixes lean on the inflected verb:

- (215) a. *Ang rua apaya-kay Latun adanyaya.*  
 ang rua apa-ya=kay Ø Latun adanya-ya  
 AT must laugh-3SG.M=a.little TOP Latun that.one-LOC

‘Latun had to laugh a little at that.’

- b. *Ya no narayang-nama va.*  
 ya no nara=yang=nama va.Ø  
 LOCT want speak=1SG.A=just 2SG.TOP

‘It is you I just want to talk to.’

## 4.6 Adverbs

Adverbs in Ayeri are the counterparts of adjectives with regards to modification of verbs and phrases. Like adjectives, they do not display agreement, though attributive adverbs may take suffixes for comparison ('run *faster*', 'climb *better*'). Adverbs may equally be modified by the usual degree suffixes. Generally, there is no rigid distinction between adverbs and adjectives, so the latter may easily be used as the former. The following subsections will discuss the different kinds of adverbs and their possible uses as modifiers.

### 4.6.1 Attributive adverbs

Attributive adverbs are words expressing the manner in which an action is carried out, or the circumstances of an event. Like adjectives, adverbs follow their heads, that is, verbs. If near-grammaticalized adverbs are involved, namely, adverbs whose function predominates over their semantic content, attributive adverbs follow these. This case is illustrated in (216a), where the attributive adjective 𐀓𐀮 *ban* 'good' follows the more functional adverb 𐀓𐀮 *iri* 'already'. In (216b), on the other hand, the descriptive adjective 𐀓𐀮 *cabo* 'late' can directly follow the verb. Further adverbs may follow in decreasing order of semantic relation to their head. With regards to grammaticalization, Lehmann (2015: 157 ff.) speaks of *bondedness* or *fugungsenge* ('closeness of construction'): the closer the bond between two juxtaposed terms is, the higher is its degree of grammaticalization. This explains why 𐀓𐀮 *iri* must follow the verb in (216a) while descriptive adverbs less central to the verb's meaning typically follow with increasing optionality.

- (216) a. *Ri rija iri ban ang Tapan palān yena.*  
           ri rig-ya iri ban ang Tapan palān-Ø yena  
           INST draw-3SG.M already well A Tapan age-TOP 3SG.F.GEN  
           'For her age, Tapan already draws well.'
- b. *Sabasaya cabo ang Niyas.*  
           saha-asa-ya cabo ang Niyas  
           come-HAB-3SG.M late A Niyas  
           'Niyas is usually late.'

Adverbs do not show agreement, however, attributive adverbs can be negated. This makes them very similar to adjectives, except that they do not modify nouns. The negative suffix for attributive adverbs is 𐀓𐀮 *-oy*, which is demonstrated in (217).

- (217) *Ersasayan napayoy ang Temisi.*  
 ers-asa-yan napay-oy Ø Temisi  
 cook-HAB-3PL.M spicy-NEG A Northerner  
 ‘The Northerners cook in an uns spicy way.’

The adjective  $\text{ᑭᑭ}$  *napay* ‘spicy’ has been seamlessly converted into an adjective here and negated to  $\text{ᑭᑭᑭ}$  *napayoy* ‘uns spicy(ly)’. The semantic difference from the same sentence with the verb negated instead of the adverb is marginal and up to the choice of the speaker:

- (218) *Ersasoyyan napay ang Temisi.*  
 ers-asa-oy-yan napay Ø Temisi  
 cook-HAB-NEG-3PL.M spicy A Northerner  
 ‘The Northerners don’t cook in a spicy way.’

#### Comparison of adverbs

Since actions are usually gradable in the way they are carried out, it is possible to compare adverbs in the same way as adjectives. Here, however, only the particle-based strategy described in section 4.3.1 can be used.

- (219) a. *Ang rije ban-eng Sipra na Tapan.*  
 ang rig-ye ban=eng Ø Sipra na Tapan  
 AT draw-3SG.F good=COMP TOP Sipra GEN Tapan  
 ‘Sipra draws better than Tapan.’  
 b. *Rije ban-vā ang Nava.*  
 rig-ye ban=vā ang Nava  
 draw-3SG.F good=SUPL A Nava  
 ‘Nava draws best.’

In order to form the comparative (219a), the suffix  $\text{ᑭᑭᑭ}$  *-eng* is appended to the adverb; the superlative (219b) carries the suffix  $\text{ᑭᑭᑭᑭ}$  *-vā* as a marker.

#### *Māy and voy*

The discourse particles  $\text{ᑭᑭ}$  *māy* ‘yes’ and  $\text{ᑭᑭᑭ}$  *voy* ‘no’ can also appear as adverbs, though since they act mainly as functional morphemes here, it is not possible for them to undergo comparison in spite of their attributive use. While  $\text{ᑭᑭ}$  *māy* ‘yes’ and  $\text{ᑭᑭᑭ}$  *voy* ‘no’ normally express affirmative and negative responses as answers to closed questions,  $\text{ᑭᑭ}$  *māy*, for one, can be used adverbially as an intensifier (220). In a similar way,  $\text{ᑭᑭᑭ}$  *voy* can be used for negative intensification (221). The negative

intensifier replaces negation on the verb in this case, though the verb may still be negated as well for very forceful negation.

- (220) a. *Nay le konja māy epang ang Kaji nernan barina sebu!*  
 nay le kond-ya māy epang ang Kaji nernan-Ø bari-na sebu  
 and PT.INAN eat-3SG.M INT then A Kaji piece-TOP meat-GEN rotten

‘And then Kaji totally ate the piece of rotten meat!’

- b. *Yāng māy karomayās nārya.*  
 yāng māy karomaya-as nārya  
 3SG.M.A INT doctor-P though  
 ‘He *is* a doctor, though.’

- (221) a. *Le vacyo voy veneyang kondan.*  
 le vac-yo voy veney-ang kondan-Ø  
 PT.INAN like-3SG.N INT.NEG dog-A food-TOP

‘The food, the dog did not like it at all.’

- b. *Adareng voy babisley niru.*  
 ada-reng voy bahis-ley niru  
 that-A.INAN INT.NEG day-P.INAN bad  
 ‘That is not a bad day at all.’

Besides this use, both 𐄧𐄫 *māy* and 𐄧𐄫𐄫 *voy* can also be used in tag questions, to reflect the expectation of a person asking with regards to the answer:

- (222) a. *Sa konjon māy patasjang keynam?*  
 sa kond-yon māy patas-ye-ang keynam-Ø  
 PT eat-3PL.N AFF bear-PL-A people-TOP

‘People, bears eat them, don’t they?’

- b. *Sa ginyon voy patasjang nimpur?*  
 sa gin-yon voy patas-ye-ang nimpur-Ø  
 PT drink-3PL.N NEG bear-PL-A wine-TOP

‘Wine, bears don’t drink it, do they?’

Example (222a) poses the question with the expectation of an affirmative answer. This is indicated by using the affirmative particle 𐄧𐄫 *māy* after the verb. Example (222b), on the other hand, indicates that the asker has doubts about the issue in question and expects their opposite to decline. The negative particle 𐄧𐄫𐄫 *voy* is placed in adverb position after the verb accordingly.

## 4.6.2 Degree and quantity

While attributive adverbs follow their heads as independent words, the most common adverbs expressing degree and quantity (quantifiers) do not only follow verbs, nouns, adpositions, adjectives, or other adverbs, but they cliticize on them, that is, they are dependent morphemes (compare section 3.2.5, p. 94). The word stem—a lexical head which is usually inflected except in the case of adjectives—serves as the host for the clitic in all these cases. Examples of degree and quantifier suffixes and how they interact with different parts of speech were already given in all the relevant sections; an example from each section is repeated here for convenience. As we will see below, there are common grading and quantifying adverbs which behave like regular adverbs as well. It is possible to combine both the suffixed and the free kinds with other adverbs as long as those adverbs permit modification with regards to degree and/or quantity. Purely functional adverbs like မရှိ *iroy* ‘not yet’ or မိမိ *sirimang* ‘about to’ may allow degree adverbs to modify them at least.

- (223) a. With a noun (7b):

*Ajayon ganang-ikan kivo.*  
 aja-yon gan-ang=ikan kivo.  
 play-3SG.N child-A=many small

‘Many small children are playing.’

- b. With an adjective (133):

*Eda-prikanreng napay-eng*  
 eda=prikan-reng napay eng  
 this=soup-A.INAN spicy rather

‘This soup is rather spicy.’

- c. With an adposition (139):

*Ang mitasaye pang-ikan mandayya tado.*  
 ang mit-asa=ye.Ø pang=ikan manday-ya tado  
 AT live-HAB=3SG.F.TOP back=much forum-LOC old

‘She used to live way behind the old forum.’

- d. With a verb (215a):

*Ang rua apaya-kay Latun adanyaya.*  
 ang rua apa-ya=kay Ø Latun adanya-ya  
 AT must laugh=3SG.M=a.little TOP Latun that.one-LOC

‘Latun had to laugh a little at that.’

A number of quantifier adverbs can be used to express both quantity and degree, especially prominent in this regard is များ *-ikan*, which comprises all of ‘many’, ‘much’ and ‘very’, as displayed in examples (223a) and (223c), where in the former

Suffix	Degree	Quantity
ᐃᐅᐅᐅ - <i>ani</i>	not at all	none at all
ᐃᐅᐅᐅᐅ - <i>aril</i>		some
ᐃᐅᐅᐅᐅᐅ - <i>eng</i>	rather, more	more
ᐃᐅᐅᐅᐅᐅᐅ - <i>hen</i>	completely	all, every, each
ᐃᐅᐅᐅᐅᐅᐅᐅ - <i>ikan</i>	much, very	many, much
ᐃᐅᐅᐅᐅᐅᐅᐅᐅ - <i>ikoy</i>	not very, less	not many, not much
ᐃᐅᐅᐅᐅᐅᐅᐅᐅᐅ - <i>ing</i>	so	
ᐃᐅᐅᐅᐅᐅᐅᐅᐅᐅᐅ - <i>kay</i>	a bit, little	few
ᐃᐅᐅᐅᐅᐅᐅᐅᐅᐅᐅᐅ - <i>ma</i>	enough	enough
ᐃᐅᐅᐅᐅᐅᐅᐅᐅᐅᐅᐅᐅ - <i>mas</i>	some kind of	
ᐃᐅᐅᐅᐅᐅᐅᐅᐅᐅᐅᐅᐅᐅ - <i>nama</i>	just, merely	just, only
ᐃᐅᐅᐅᐅᐅᐅᐅᐅᐅᐅᐅᐅᐅᐅ - <i>ngas</i>	almost	
ᐃᐅᐅᐅᐅᐅᐅᐅᐅᐅᐅᐅᐅᐅᐅᐅ - <i>nyama</i>	even	
ᐃᐅᐅᐅᐅᐅᐅᐅᐅᐅᐅᐅᐅᐅᐅᐅᐅ - <i>vā</i>	most	most
ᐃᐅᐅᐅᐅᐅᐅᐅᐅᐅᐅᐅᐅᐅᐅᐅᐅᐅ - <i>ven</i>	pretty, quite	

[illegible]

- 'I'm extremely glad to see you.'

## 4.6.3 Sentence adverbs

Ayeri allows adverbs to modify sentences, for instance, to express the stance of the speaker, to concede an argument, or simply to structure an argumentative chain.

*Stance adverbs*

Adverbs indicating the stance of the speaker towards an assertion or a statement are, for instance: *ᐱᑦᑦᑦ ankyu* ‘really’, *ᑦᑦᑦᑦ cuyam* ‘actually, indeed, in fact’, *ᐱᑦᑦᑦ kalam* ‘honestly’, *ᐱᑦᑦᑦ kuban* ‘fortunately’, *ᐱᑦᑦᑦ kuniru* ‘unfortunately’, *ᑦᑦᑦᑦ nilay* ‘probably’, *ᐱᑦᑦᑦ yoming* ‘maybe, perhaps’. These adverbs are usually placed after the verb like any other attributive adverb, even though their scope is over the whole clause. It is also possible to place them towards the end of the clause they are used in, however. Example (225) gives an example of either position.

- (225) a. *Ang ming bengya kuban Tipal vabamya bavesangena nā.*  
 ang ming beng-ya kuban Ø Tipal vaham-ya bavesang-ena nā  
 AT can attend-3SG.M fortunately TOP Tipal party-LOC birthday-GEN 1SG.GEN  
 ‘Fortunately, Tipal can attend my birthday party.’
- b. *Sabayāng cabo-kay nilay nārya.*  
 saha=yāng cabo=kay nilay nārya  
 come=3SG.M late=a.little probably though  
 ‘He will probably come a little late, though.’

*Discourse-structuring adverbs*

Ayeri does not have a great number of concessive adverbs, that is, *ᐱᑦᑦᑦ arēn* ‘however, anyway’ and *ᑦᑦᑦᑦ nārya* ‘although, though; nevertheless’ do most, if not all the work. Like adverbs expressing stance, they may follow the verb or be placed at the end of the clause. Example (225b) above already shows an example of *ᑦᑦᑦᑦ nārya* being used as a sentence adverb. With regards to this word, it is important to note that *ᑦᑦᑦᑦ nārya* may also be used as a general contrastive conjunction which can mostly be translated as ‘but’. In this sense, its placement in a clause creates a slight difference in meaning, as illustrated by example (226) below.<sup>42</sup>

<sup>42</sup> Possibly it is easier not to distinguish between conjunction and adverb at all in this case and instead to treat *ᑦᑦᑦᑦ nārya* as an adverb with a general contrastive meaning which can exceptionally be found at the beginning of a clause as well.

- (226) a. *Garayang, nārya guraca ranyāng.*  
 gara=yang nārya gurat-ya ranya-ang  
 call=1SG.A but answer-3SG.M nobody-A  
 ‘I called, but nobody answered.’
- b. *Garayang, guraca nārya ranyāng.*  
 gara=yang gurat-ya nārya ranya-ang  
 call=1SG.A answer-3SG.M although nobody-A  
 ‘I called, although nobody answered.’

Besides the two adverbs mentioned above, there is also *da-nārya* ‘even though, in spite of, despite’ as a postposition with a contrastive meaning (see section 4.4.2). As an adposition it accepts either a noun phrase or a complement phrase (CP) as a complement. In the latter case, which is shown in (227b), there is no locative case agreement of the whole CP with the postposition, since there is no fitting agreement target to attach it to.

- (227) a. *Ya precang nanga yena* [PP [NP *sarānya yena*] *da-nārya*].  
 ya pret=yang nanga-Ø yena sarān-ya yena da-nārya  
 LOCT knock=1SG.A house-TOP 3SG.F.GEN absence-LOC 3SG.F.GEN in.spite  
 ‘I knocked at her house in spite of her absence.’
- b. *Precang* [PP [CP *ang yomoyye rangya yena*] *da-nārya*].  
 pret=yang ang yoma-oy=ye.Ø rang-ya yena da-nārya  
 knock=1SG.A AT exist-NEG=3SG.F.TOP home-LOC 3SG.F.GEN even.though  
 ‘I knocked, even though she wasn’t at home.’

Further adverbs which are commonly used as adverbial expressions and which may appear in the presentation of arguments include: *deramyam* ‘after all’, *kaybunay* ‘by the way’, *ku-nasya* ‘as follows’, *menanya* ‘on the one hand’, *mirampaluy* ‘otherwise’, *nāreng* ‘rather’, *naynay* ‘(and) also, moreover, furthermore’, *palunganya* ‘on the other hand’, *panca* ‘finally, eventually, in the end’, *pinyan* ‘please’, *subing* ‘naturally, of course’. It should be apparent by the complexity and relative length of some of these words that they are fossilized expressions, for instance, *deramyam* ‘after all’ transparently derives from *deram* ‘matter of fact’ declined for dative case (*yam*, see section 4.1.3); *ku-nasya* is derived from a phrase literally meaning ‘as (it) follows’; and *palunganya* ‘on the other hand’ literally means ‘in difference’, from *palungan* ‘difference, distinction’. Of the list given above, it may be noted that *pinyan* ‘please’ (from *pinya-* ‘ask’) is often found at the beginning of polite requests:

- (228) *Pinyan, sahu kongya!*  
 pinyan saha-u kong-ya  
 please come-IMP inside-LOC  
 ‘Please come inside!’

### Conjunctive adverbs

The term ‘conjunctive adverb’ here refers to sentence adverbs which have the distribution of a conjunction. Whereas sentence adverbs are normally placed either after the verb or at the end of a clause, these words are usually found as introducing clauses since they connect two otherwise independent statements to show their relation to each other. Their meaning extends that of the ‘pure’, logical conjunctions *ꠞꠞ* *nay* ‘and’ and *ꠞꠞꠞ* *soyang* ‘or’, however.<sup>43</sup> Part of this small class of words are the expressions *ꠞꠞꠞ* *bata* ‘if, whether’,<sup>44</sup> *ꠞꠞꠞ* *kada* ‘then, thus’, *ꠞꠞꠞꠞꠞ* *kada-kada* ‘so that ... again’, *ꠞꠞꠞꠞ* *kadāre* ‘so that’, *ꠞꠞꠞꠞ* *naynay* ‘moreover, furthermore, and also’, *ꠞꠞꠞꠞ* *nāreng* ‘(but) rather’, *ꠞꠞꠞꠞ* *nāroy* ‘but not’, *ꠞꠞꠞꠞ* *nārya* ‘but, except that, though, yet’, *ꠞꠞꠞꠞ* *sining* ‘that is’, and *ꠞꠞꠞꠞ* *yanoyam* ‘because, for, since’.

- (229) a. *Le rimasayang kunang sirutayya, kadāre ming toryang*  
 le rima-asa=yang kunang-Ø sirutay-ya kadāre ming tor=yang  
 PT.INAN shut-HAB=ISG.A door-TOP night-LOC so.that can sleep=ISG.A  
*ban-eng.*  
 ban=eng  
 good=COMP  
 ‘I usually close the door at night so that I can sleep better.’
- b. *Ilta toryeng, nārya da-kilisoyyon nilanjang yena.*  
 ilta tor=yeng nārya da=kilis-oy-yon nilan-ye-ang yena  
 need sleep=3SG.F.A but so=allow-NEG-3PL.N thought-PL-A 3SG.F.GEN  
 ‘She needed to sleep, but her thoughts did not allow her to.’
- c. *Ang ming bangoyya Yan padangas, yanoyam yāng pisu.*  
 ang ming hang-oy-ya Ø Yan padang-as yanoyam yāng pisu  
 AT can keep-NEG-3SG.M TOP Yan mind-P because 3SG.M.A tired  
 ‘Yan cannot concentrate because he is tired.’

Regarding (229b), it needs to be pointed out that *ꠞꠞꠞꠞ* *nārya* can also be used as a regular adverb. In those cases it is considered to have less contrastive force,

<sup>43</sup> Logical ‘not’ is usually expressed by a negative suffix on the adjective or the verb, compare sections 4.3.2 and 4.5.4, respectively. For conjunctions proper, see section 4.8.

<sup>44</sup> Conditional protasis and apodosis are usually unmarked in Ayeri, however, it may still be desirable occasionally to use a particle to indicate them explicitly.

however: postposed  $\text{ၵၵၵၵ}$  *nārya* is best translated as ‘though, although’ (compare section 4.6.3).

Since verbs can be negated and reduplicated for grammatical purposes, the adverbs  $\text{ၵၵၵၵ}$  *kada-kada* ‘so that ... again’ and  $\text{ၵၵၵၵ}$  *nāroy* ‘but not’ are mostly used with predicative adjectives, since equative statements lack a verb to apply verb morphology to. These two conjunctive adverbs thus can convey the most important distinctions otherwise expressed by the verb as a substitute. This ability, however, is not a productive grammatical process, but specific to  $\text{ၵၵၵၵ}$  *kada-kada* and  $\text{ၵၵၵၵ}$  *nāroy*, respectively.

- (230) a. *Rua nibaya ang Pulan, kada-kada yāng sapin tadayya kivo.*  
 rua niba-ya ang Pulan kada~kada yāng sapin taday-ya kivo  
 must rest-3SG.M A Pulan ITER~so.that 3SG.M.A healthy time-LOC little  
 ‘Pulan must rest so that he will be healthy again very soon.’
- b. *Yang temisena cuyam, nāroy yang petau.*  
 yang temis-ena cuyam nāroy yang petau  
 1SG.A north-GEN indeed but.not 1SG.A stupid  
 ‘I may be from the north, but I am not stupid.’

As described above (compare section 4.5.3), partial reduplication of the verb expresses iterative aspect, which in Ayeri is used to mean ‘VERB again’ and ‘VERB back’, depending on context. The reduplicated form  $\text{ၵၵၵၵ}$  *kada-kada* as displayed in (230a) is irregular in its formation if we assume that it is formed from  $\text{ၵၵၵၵ}$  *kadāre* ‘so that’; the regular outcome with iterative reduplication applied would be  $\text{ၵၵၵၵ}$  *\*ka-kadāre*. As a conjunction, however, it is relatively frequent, so it does not seem odd that it has assumed a phonologically more simple, yet distinct form (compare, for instance, Bybee and Hopper 2001: 11–12). The conjunctive adverb in (230b) exhibits likewise a slightly irregular formation if we consider that it is essentially the negated form of  $\text{ၵၵၵၵ}$  *nārya* ‘but’; the regular outcome would have been  $\text{ၵၵၵၵ}$  *\*nāryoy*, which underwent simplification to  $\text{ၵၵၵၵ}$  *nāroy*, presumably as well due to its relatively high token frequency.

#### 4.6.4 Demonstrative adverbs

Besides demonstrative pronouns like  $\text{ၵၵၵၵ}$  *adanya* ‘that (one)’ (see section 4.2.2), and indefinite pronouns like  $\text{ၵၵၵၵ}$  *yāril* ‘for some reason; somewhere’ (see section 4.2.4), Ayeri also possesses demonstrative pronouns for the adverbial categories place, time, manner, and reason. The full paradigm is given in Table 4.26. Compared to the paradigm for demonstrative pronouns relating to persons or things, the paradigm of adverbial demonstratives is incomplete in that forms with  $\text{ၵၵ}$  *da-* ‘such’ are unattested. Thus, instead of the hypothetical form with  $\text{ၵၵ}$  *da-*, a full-NP adverbial

Table 4.26: Demonstratives relating to adverbial categories

Category	Proximal		Distal	
PLACE	<i>edaya</i>	‘here’	<i>adaya</i>	‘there’
TIME	<i>edaui</i>	‘now’	<i>adaui</i>	‘then’
MANNER	<i>edāre</i>	‘hereby’	<i>adāre</i>	‘thereby’
REASON	<i>edayam</i>	‘herefore’	<i>adayam</i>	‘therefore’

with a generic noun has to be used: \* $\text{ᠠᠳᠠ}$  \**daya*  $\rightarrow$   $\text{ᠠᠳᠠᠶᠠᠨᠣᠶ᠋ᠠ}$  *da-yanoya* ‘in such a place’ (such-place-LOC). Adverbial demonstratives are, like pronouns, in complementary distribution with full NPs, since they are pro-forms. Thus, using them as modifiers to NPs as in (231a) is not possible, while using simple demonstrative  $\text{ᠠᠳᠠ}$  *eda* ‘this’ together with a noun as in (231b) or using  $\text{ᠠᠳᠠᠶ᠋ᠠ}$  *edaya* ‘here’ as a pro-form fully replacing the NP  $\text{ᠠᠳᠠᠨᠠᠭᠠᠶ᠋ᠠ}$  *eda-nangaya* ‘in this house’ as in (231c) is generally unproblematic.

- (231) a. \**Ang mice Pada nangaya edaya.*  
 ang mit-ye Ø Pada nanga-ya edaya  
 AT live-3SG.F TOP Pada house-LOC here
- b. *Ang mice Pada eda-nangaya.*  
 ang mit-ye Ø Pada eda=nanga-ya  
 AT live-3SG.F TOP Pada this=house-LOC  
 ‘Pada lives in this house.’
- c. *Mice ang Pada edaya.*  
 mit-ye ang Pada edaya  
 live-3SG.F A Pada here  
 ‘Pada lives here.’

## 4.7 Numerals

The vast majority of the 196 sampled languages in Comrie (2013) either counts in tens or employs a mixed vigesimal-decimal system, while only five languages in the sample use a different base than 10. Ayeri uses a duodecimal system and is thus very untypical compared to real-world languages in using a number base other than 10—none of the languages in Comrie (2013)’s sample are listed as duodecimal.<sup>45</sup>

<sup>45</sup> I chose to use 12 as a numerical base because I simply wanted to toy with it. Also, I originally conceived of Ayeri speakers as humanoid but not necessarily human, which meant that they

Ayeri's number words are mostly semantic primes, that is, their meanings cannot be readily recognized as derived from body parts (Dixon 2012: 74) or from internal arithmetic like 9 as 'ten lacking one', for instance. The numerals ꠠꠢ *kay* 'three', ꠠꠣ *iri* 'five', and ꠠꠤ *ben* 'eight' may be an exception: as a quantifying adverb, ꠠꠢ *kay* means 'a little, few'; ꠠꠣ *iri* means 'already', which might refer to the fact that a full hand has been counted off; and ꠠꠤ *ben* also means 'all'. Ayeri moreover appears extremely sophisticated as far as the upper limit of counting systems is concerned in possessing a way of forming large numerals by a theoretically open-ended, recursive process.

#### 4.7.1 Cardinal numerals

Since people and concrete things are usually present in a countable manner, I want to comment first on how countable entities are handled with regards to numerals. After this, a discussion of how to express fractional amounts will follow.

##### *Integers*

Cardinal numerals work much like adjectives in that they modify nouns. As modifiers, they are placed after nouns. The full table of cardinal numerals from  $0 \times 12^\circ$  (o) to  $11 \times 12^\circ$  (B) is given in Table 4.27.<sup>46</sup> An example of simple modification by a numeral is given in (232):

- (232) *Ang tenyaya pang bihanya yo soyang miye.*  
 ang tenya=ya pang bihan-ya yo soyang miye  
 AT die=3SG.M.TOP ago week-LOC four or six

'He died four or six weeks ago.'

would not need to have evolved to have five fingers on each hand—for an earlier fictional language of mine, Daléian, I used an octal system reasoning that speakers would only have four digits. In any case, a duodecimal system could work reasonably well with human hands if you counted not only the fingers, but also the hands themselves. Finger-counting in Ayeri's duodecimal system would probably be similar to counting in the senary system of Nén described in Evans (2009) (as quoted in Dixon 2012): "In counting, Nén speakers 'first count off the five fingers with a finger of their other hand, and then on the sixth they place their counting finger on the inside of the wrist'" (73–74). Even though duodecimal numeral systems only occur rarely in natural languages, they are not entirely unheard of. Thus, for instance, Cain and Gair (2000) report that in Maldivian, the "decade plus numeral system is currently in fashion, but with some remnants of an older system as well. The numeral *fas dolas* '60' (lit., 'five twelves') comes from a duodecimal system that has all but disappeared in the Maldives. This number system was used for special purposes such as counting coconuts" (21).

<sup>46</sup> For the sake of typographic simplicity, A and B will henceforth be used to mean  $10 \times 12^\circ$  and  $11 \times 12^\circ$ , respectively. An index '10' after a figure indicates base 10, while an index '12' indicates base 12.

Table 4.27: Basic cardinal numerals

Numeral	Word	Numeral	Word
0	ညံ့ <i>ja</i>	6	မိပ် <i>miye</i>
1	မံင် <i>men</i>	7	မိပ် <i>ito</i>
2	မံ <i>sam</i>	8	မံင် <i>hen</i>
3	မံင် <i>kay</i>	9	မံင် <i>veya</i>
4	ယို <i>yo</i>	A	မံင် <i>mal</i>
5	မိပ် <i>iri</i>	B	မံင် <i>tam</i>

Table 4.28: Numerals for factors of 12

Numeral	Word	Numeral	Word
		60	မိပ်မံင် <i>miyelan</i>
10	မံင်မံင် <i>menlan</i>	70	မိပ်မံင် <i>itolan</i>
20	မံင်မံင် <i>samlan</i>	80	မံင်မံင် <i>henlan</i>
30	မံင်မံင် <i>kaylan</i>	90	မံင်မံင် <i>veyalan</i>
40	ယိုမံင် <i>yolan</i>	A0	မံင်မံင် <i>mallan</i>
50	မိပ်မံင် <i>irilan</i>	B0	မံင်မံင် <i>tamlan</i>

In this example, the numeral ယို *yo* ‘four’ modifies the noun မိပ်မံင် *bihan* ‘week’. Notably, however, plural marking is missing on the noun, since the notion of plurality is provided by the numeral itself; the numeral is thus normally sufficient to mark the whole NP as plural.

Multiples of 12<sup>1</sup> between 10 and 80 are formed by appending the suffix *-lan* to the numbers from 0 to B, which are given in Table 4.28. These numerals themselves act as heads for forming compounds with lower numerals to fill in the 12° numerals 11, 12, 13, ..., 21, 22, 23, etc. Thus, one counts on from မံင်မံင် *menlan* ‘dozen’ in the following way:

- (233) a. မံင်မံင်မံင် *menlan-men* (11),  
 မံင်မံင်မံင် *menlan-sam* (12),  
 မံင်မံင်မံင် *menlan-kay* (13),  
 etc.
- b. မံင်မံင်မံင် *samlan-men* (21),  
 မံင်မံင်မံင် *samlan-sam* (22),  
 မံင်မံင်မံင် *samlan-kay* (23),  
 etc.

- c.  $\text{ṭamlan-men}$  (B1),  
 $\text{ṭamlan-sam}$  (B2),  
 $\text{ṭamlan-kay}$  (B3),  
 etc.

In order to form yet higher numbers, the suffix  $\text{-nang}$  is appended to numerals:  $\text{ṭenang}$  ( $\leftarrow \text{ṭen}$  '1' +  $\text{-nang}$ ),  $\text{samang}$  '2' ( $\leftarrow \text{sam}$  +  $\text{-nang}$ ),  $\text{kaynang}$  ( $\leftarrow \text{kay}$  '3' +  $\text{-nang}$ ), etc. While  $\text{ṭenang}$  is used for 100, higher forms in the *nang* series each multiply the numeral from which they are derived by the factor of a duodecimal myriad ( $= 20\,736_{10}$ ). Thus, we get the following series:

- (234)  $\text{samang}$   $12^{(2-1) \times 4} = 12^4$  myriad  
 $\text{kaynang}$   $12^{(3-1) \times 4} = 12^8$  myriad myriads  
 $\text{yonang}$   $12^{(4-1) \times 4} = 12^{12}$  myriad myriad myriads  
 $\text{irinang}$   $12^{(5-1) \times 4} = 12^{16}$  myriad myriad myriad myriads  
 etc.

The numeral which the *nang* series word is based on essentially indicates the number of myriad groups, thus, *1-nang* maximally contains BBBB; *2-nang* maximally contains BBBB BBBB; *3-nang* maximally contains BBBB BBBB BBBB, etc. Furthermore, the *nang* series words serve as unit words, and thus can be modified by numerals again, for instance:

- (235) a.  $\text{ṭenang sam veyalan-kay}$   
           100    2    90    3  
            $293_{12} = 399_{10}$   
 b.  $\text{samang benlan-miye ṭenang sam veyalan-kay}$   
      1 0000   80    6    100   2    90    3  
       $86\,0293_{12} = 2\,115\,471_{10}$

In (235a), *sam* modifies  $\text{ṭenang}$  to indicate that there are two sets of  $100_{12}$ . Likewise, in (235b), *samang* is modified by  $\text{benlan-miye}$  to mean  $86_{12}$  times  $10\,000_{12}$ . Unit words like  $\text{ṭenang}$ , *samang*, etc. may also be used as (inanimate) nouns, so it is possible to speak of  $\text{ṭenangye}$  'hundreds'. To express 'hundreds of people', however, the head of the genitive NP is pluralized exceptionally, even if it is a *plurale tantum*:

- (236) a.  $\text{Ang bengyon keynam ṭenang kanānya desay iray.}$   
          ang beng-yon   keynam-Ø   ṭenang   kanān-ya   desay iray  
          AT   attend-3PL.N   people-TOP   hundred   wedding-LOC   royal  
          'A hundred people attended the royal wedding.'

- b. *Ang bengyon keynamye menang kanānya desay iray.*  
 ang beng-yon keynam-ye-Ø menang kanān-ya desay iray  
 AT attend-3PL.N people-PL-TOP hundred wedding-LOC royal  
 ‘Hundreds of people attended the royal wedding.’

In (236), *keynam* is morphologically a singular form referring semantically to a multitude. It is usually treated as a **plurale tantum** in that it triggers plural agreement in spite of being morphologically singular, which is illustrated in (236a). In (236b), the word still receives otherwise redundant plural marking to express the difference in meaning from (236a).

In order to indicate that myriad groups have been skipped, the conjunction *ṛṇay* ‘and’ is used to avoid confusion, as shown in (237), or simply to avoid having two single-digit numerals following each other, as illustrated by (238).

- (237) a. *samang menang men benlan-miye*  
 1 0000 100 1 80 6  
 $186\ 0000_{12} = 5\ 101\ 056_{10}$
- b. *samang menang men ṛṇay benlan-miye*  
 1 0000 100 1 and 80 6  
 $100\ 0086_{12} = 2\ 986\ 086_{10}$

- (238) a. *ṛṇay menang mal ito*  
 100 A 7
- b. *menang mal ṛṇay ito*  
 100 A and 7  
 $A07_{12} = 1\ 447_{10}$

### Fractions

So far, we have explored only integers, that is, whole numbers. Since things can often be divided up into smaller sections as well, this section is going to deal with how to express fractional amounts. The main way to express common fractions like  $\frac{1}{2}$ ,  $\frac{1}{3}$ ,  $\frac{1}{4}$ , etc. is to prepend *men* ‘one’ to the denominator; the full paradigm for  $\frac{1}{2}$  to  $\frac{1}{B}$  is given in Table 4.29. Note that a number of these fractions have slightly irregular forms due to assimilation in consonant clusters. In order to introduce a numerator, the fraction numeral is used as a unit word which is modified by a regular cardinal numeral, as (239) shows.

Table 4.29: Simple fractions from  $\frac{1}{2}$  to  $\frac{1}{6}$ 

Numeral	Word	Numeral	Word
$\frac{1}{2}$	မေဗေ <i>mesam</i>	$\frac{1}{7}$	မေဗို <i>menito</i>
$\frac{1}{3}$	မေဗ် <i>menkay</i>	$\frac{1}{8}$	မေဗို <i>menyen</i>
$\frac{1}{4}$	မေဗို <i>menyo</i>	$\frac{1}{9}$	မေဗို <i>menveya</i>
$\frac{1}{5}$	မေဗို <i>meniri</i>	$\frac{1}{A}$	မေဗို <i>memal</i>
$\frac{1}{6}$	မေဗို <i>memiye</i>	$\frac{1}{B}$	မေဗို <i>mentam</i>

- (239) a. *Ang ilca Yan vadiśānley mesam.*  
ang ilt-ya Ø Yan vadiśān-ley mesam  
AT buy-3SG.M TOP Yan bread-P.INAN half  
‘Yan bought half a loaf of bread.’
- b. *Ang ilce Mali sikanley menyo kay kipunena.*  
ang ilt-ye Ø Mali sikan-ley menyo kay kipunena  
AT buy-3SG.M TOP Mali pound-P.INAN fourth three cheese-GEN  
‘Mali bought a three-quarter pound of cheese.’

In order to express compound numerals, မေဗို *men-* may still be added to the denominator head word, for instance

- (240) *memallan-ben*  
men-mallan-hen  
 $1/10 \times 12^1 + 8$   
 $\frac{1}{A8_{12}} = \frac{1}{128_{10}}$

However, this may become confusing if numerators are used, so

- (241) *memenang ito menlan-yo kay*  
men-menang ito menlan-yo kay  
 $1/12^2$  7  $1 \times 12^1 + 4$  3  
 $\frac{3}{714_{12}} = \frac{3}{1024_{10}}$

would be expressed less ambiguously as

- (242) *menangan ito menlan-yo nernanyena kay*  
menang-an ito menlan-yo nernan-ye-na kay  
 $12^2$ -NMLZ 7  $1 \times 12^1 + 4$  part-PL-GEN 3  
‘three of the 1024th part’

Table 4.30: Basic ordinal numerals

Numeral	Word	Numeral	Word
0th	གཤམ་ <i>jān</i>	6th	མྱུ་ <i>miyan</i>
1st	མེན་ <i>menan</i>	7th	ཞེན་ <i>itan</i>
2nd	མམ་ <i>saman</i>	8th	མེན་ <i>henan</i>
3rd	མུ་ <i>kayan</i>	9th	མེན་ <i>veyān</i>
4th	ཡ་ <i>yan</i>	10th	མེན་ <i>malan</i>
5th	མེན་ <i>iran</i>	11th	མེན་ <i>taman</i>

using the ordinal form of the denominator.

#### 4.7.2 Ordinal numerals

Ordinal numerals are formed by nominalization from cardinal numerals. This may be another slightly odd strategy, however, it is in fact attested in Classical Tibetan, according to Chung et al. (2014), in reference to Beyer (1992):

The suffix *-pa* forms a noun from another noun, meaning ‘associated with N’ (e.g. *rta* ‘horse,’ *rta-pa* ‘horseman,’ *yi-ge* ‘letter,’ *yi-ge-pa* ‘one who holds a letter of office,’ cf. Beyer 1992: 117). When suffixed to ordinal numbers this suffix forms ordinals (e.g. *gsum* ‘three,’ *gsum-pa* ‘third’; *bcu* ‘ten,’ *bcu-pa* ‘tenth’). (Chung et al. 2014: 626)

Unfortunately, neither Chung et al. (2014) nor Beyer (1992) say whether Classical Tibetan treats these derived forms as nouns or as numerals, or whether it makes that distinction at all. In Ayeri, ordinals are firmly treated as noun-like nominal elements due to the derivational suffix *-an* (compare section 4.1.7). Since nominals are the heads of NPs, this also means that the ordinal numeral forms the head of the NP it occurs in, instead of modifying the entity being counted like an ordinal numeral does. This is illustrated in (243) below. The paradigm for the ordinal numerals from 0 to 8 can be found in Table 4.30.

- (243) a. *Ang Mahān menanas.*  
 ang Mahān menan-as  
 A Mahān first-P  
 ‘Mahan is the first.’
- b. *Ang Mahān menanas si girenjāng.*  
 ang Mahān menan-as si girend=yāng  
 A Mahān first-P REL arrive=3SG.M.A  
 ‘Mahān is the first to arrive.’

- c. *Ang girenja Mahān babalanya ku-menan diyan*  
 ang girend-ya Ø Mahān bahalan-ya ku=menan diyan  
 A arrive-3SG.M TOP Mahān finish-LOC like=first worthy  
 ‘Mahān arrives at the finish as a worthy first.’
- d. *Ang tavya Mahān menanas ganyena yana.*  
 ang tav-ya Ø Mahān menan-as gan-ye-na yana  
 AT get-3SG.M TOP Mahān first-P child-PL-GEN 3SG.M.GEN  
 ‘Mahān gets his first child’,  
 literally: ‘Mahān gets the first of his children.’

As (243a) shows, the ordinal may serve as an anaphora meaning ‘the *n*th (one)’. In these cases, animacy is determined by the word the ordinal references, as far as case marking and person agreement are concerned. Since ordinals are treated as nominals, they can also be modified by both a relative clause, as (243b) shows, and an adjective, as shown in (243c). In order to include an entity whose rank in a series is given, the counted entity appears as a genitive attribute, which is illustrated by (243d).

So far, only single-digit ordinals have been described. In order to form higher ordinals, the head unit word receives the nominalizer with the rest of the term trailing as a modifier, otherwise the number word as such is nominalized. Essentially, an ordinal in the ‘teens’<sup>47</sup> behaves like a ‘tight’ noun compound, while ordinals involving unit words for powers of 12 higher than 1 behave as ‘loose’ compounds (compare section 4.1.5, p. 130).

- (244) a. *Adareng kaylan-miyanley bahisyena pericanena.*  
 ada-reng kaylan-miye-an-ley bahis-ye-na perican-ena  
 that-A.INAN  $3 \times 12^1 + 6$ -NMLZ-P.INAN day-PL-GEN year-GEN  
 ‘It is the 36th (= 42nd) day of the year.’
- b. *Adareng menanganley kaylan-miye bahisyena pericanena.*  
 ada-reng menang-an-ley kaylan-miye bahis-ye-na perican-ena  
 that-A.INAN  $12^2$ -NMLZ-P.INAN  $3 \times 12^1 + 6$  day-PL-GEN year-GEN  
 ‘It is the 136th (= 186th) day of the year.’

In (244a), the whole numeral  $\text{𑜋𑜨𑜃𑜫𑜄𑜪𑜫}$  *kaylan-miye* is nominalized and inflected for case, yielding  $\text{𑜋𑜨𑜃𑜫𑜄𑜪𑜫𑜄𑜪𑜫}$  *kaylan-miyanley*. This is analogous to such nouns as  $\text{𑜋𑜨𑜃𑜫𑜄𑜪𑜫}$  *betaynimpur* ‘grape’ (literally ‘wine-berry’), which inflects as a single unit—a ‘tight’ compound. In (244b), on the other hand, only the first unit word,  $\text{𑜋𑜨𑜃𑜫𑜄𑜪𑜫}$  *menang* is nominalized and inflected, yielding  $\text{𑜋𑜨𑜃𑜫𑜄𑜪𑜫𑜄𑜪𑜫}$  *menanganley* with  $\text{𑜋𑜨𑜃𑜫𑜄𑜪𑜫}$

<sup>47</sup> More specifically,  $a \times 12^1 + b$  with  $\{a, b \in \mathbb{Z} \mid 0 < a, b < 12^1\}$ .

- (246) a. *kaylan-tamanyam*  
           *kay-lan-tam-an-yam*  
            $3 \times 12^1 + 11$ -NMLZ-DAT  
           ‘ $_{3B}$  (=  $47_{10}$ ) times’
- b. *menanganyam*    *men samlan-kay*  
       *menang-an-yam*    *men sam-lan-kay*  
        $12^2$ -NMLZ-DAT    I     $2 \times 12^1 + 3$   
       ‘ $_{123}$  (=  $171_{10}$ ) times’

#### 4.7.4 Distributive numerals

Distributive numerals are formed similar to multiplicative numerals in that they are based on a derivation of the respective ordinal numeral, which itself has the form of a nominalized cardinal numeral (compare Table 4.30). The derivative affix in this case is the instrumental marker,  $\text{ᄒᆞᆫ}$  *-eri* (compare section 4.1.3). Distributive numerals refer to groups of *n*, as example (247) shows.

- (247) *Ang sarayon burangjang kong besonya samaneri.*  
 ang sara-yon burang-ye-yang kong beson-ya sam-an-eri  
 AT go-3PL.N animal-PL-A inside ship-LOC two-NMLZ-INS

‘The animals went inside the ship two by two.’

The formation of composite numerals mirrors that of multiplicative numerals, in that composite numerals below  $12^1$  are treated as single units whereas composite numerals of orders of magnitude larger than  $12^1$  mark only the head word while the remainder of the phrase follows as an uninflected modifier.

- (248) a. *benlan-yaneri*  
 hen-lan-yo-an-eri  
 $8 \times 12^1 + 4$ -NMLZ-INS  
 ‘84 by 84 (=  $100_{10}$ )’  
 b. *menanganeri miye tamlan-yo*  
 menang-an-eri miye tam-lan-yo  
 $12^2$ -NMLZ-INS 6  $11 \times 12^1 + 4$   
 ‘6B4 by 6B4 (=  $1000_{10}$ )’

#### 4.7.5 Number ranges

Ranges of cardinal numbers may be viewed as conceptually similar to stretches of way, hence they are predestined to be expressed by prepositional phrases, or in Ayeri, by any of the cases which can be used for locative purposes (dative, genitive, locative). However, Ayeri treats cardinal numerals more like adjectives than nouns, so using means of case marking is not possible. On the other hand, adpositions take both NPs and CPs as complements, so that an adjective should be able to act as a complement to an adposition as well. Since the numeral in the PP is treated like an adjective, it is not marked for locative case, since adjectives do not inflect for nominal categories (compare section 4.3). Ranges of cardinal numbers may hence be expressed using the postposition  $\text{ᄒᆞᆫ}$  *pesan* ‘(up) until’. When counting starts at  $\text{ᄒᆞᆫ}$  *men* ‘one’, this numeral may be dropped, like in English ‘count to ten’ instead of ‘count from one to ten’.

- (249) *Kurye ang Pila (men) tam pesan.*  
 kur-ye ang Pila (men) tam pesan  
 count-3SG.F A Pila (I) B until  
 ‘Pila counts from I to B (= I ... II<sub>10</sub>).’

Since ordinal numerals are treated as nouns, they may receive case marking. This means that, in contrast to cardinal numerals, it is possible to express a range using a combination of the genitive and the dative case, or again *pesan* with its prepositional object in the locative case. Context is needed to disambiguate whether the dative form of the numeral is a multiplicative derivation or an actual ordinal numeral in the dative case. Examples for this are given in (250).

- (250) a. *Ang gumasaya samanena pidimyena da-malanyam.*  
 ang gum-asa=ya saman-ena bahis-ye-na da=malan-yam  
 AT work-HAB=3SG.M.TOP second-GEN hour-PL-GEN such=tenth-DAT  
 ‘He usually works from the second hour to the tenth.’
- b. *Ang yomaya Magay diyan edaya benanena babisyena*  
 ang yoma-ya Ø Magay diyan edaya henan-ena bahis-ye-na  
 AT exist-3SG.M TOP Magay worthy here eighth-GEN day-PL-GEN  
*da-menlananya pesan.*  
 da-menlanan-ya pesan  
 such-dozen-th-LOC until  
 ‘Mr. Magay is here from the eighth to the dozen-th day.’

*samanena* ‘from the first’ in (250a) and *benanena* ‘from the eighth’ in (250b) use the genitive case marker *-ena* (compare section 4.1.3) to indicate the starting point. *da-malanyam* ‘to the tenth one’ and *da-menlananya pesan* ‘up until the dozen-th one’ indicate the end points. Since *menlan* in (250b) is embedded in a PP headed by the postposition *pesan*, it appears in the locative case instead of the dative case like *malan* in (250a).

## 4.8 Conjunctions

section 4.6.3 already dealt with conjunctive adverbs as sentence adverbs and their conjunction-like behavior. The present section is about the ‘purely logical’ conjunctions *ꠘꠗ* *nay* ‘and’ and *ꠘꠗꠘꠗ* *soyang* ‘or’, as well as their combination with *ꠘꠗꠘꠗ* *kamo* ‘equal(ly)’ to form correlative conjunctions.

### 4.8.1 Simple conjunction and disjunction

Coordination is commonly achieved by the conjunction  $\text{ꠘ}$  *nay* ‘and’. It is placed in between the conjuncts, and works on all syntactic levels. Namely, it may coordinate lexical heads, as well as phrases, and whole clauses.

- (251) a.  $[\text{AP}[\text{A } \text{Tarán}] \text{ } \text{nay} \text{ } [\text{A } \text{saco}]] \text{ } \text{nangāng}$ .  
           Tarán    nay    saco    nanga-ang  
           quiet   and   cool   house-A  
           ‘The house is quiet and cool.’
- b. *Ajayan*     $[\text{NP } \text{yanang}] \text{ } \text{nay} \text{ } [\text{NP } \text{layang}]$ .  
   aja-yan       yan-ang   nay   lay-ang  
   play-3PL.M   boy-A     and   girl-A  
           ‘The boy and the girl are playing.’
- c.  $[\text{S } \text{nāng } \text{pisu}] \text{ } \text{nay} \text{ } [\text{S } \text{tapannang}]$ .  
      nāng   pisu   nay   tapan-nang  
      IPL.A   tired   and   be.thirsty-IPL.A  
           ‘We are tired and are thirsty.’

The example sentences in (251) are ordered by increasing level of coordination: (251a) combines two adjective-phrase (AP) heads,  $\text{ꠘ}$  *tarán* ‘quiet’ and  $\text{ꠘ}$  *saco* ‘cool’, which together make up the predicative AP that is equated to  $\text{ꠘ}$  *nangāng* ‘a/the house’. In (251b), then, two agent NPs,  $\text{ꠘ}$  *yanang* ‘a/the boy’ and  $\text{ꠘ}$  *layang* ‘a/the girl’, together form the subject of the verb  $\text{ꠘ}$  *ajayan* ‘play’. Lastly, (251c) shows two main clauses coordinated, that is,  $\text{ꠘ}$  *nāng pisu* ‘we are tired’ on the one hand, and  $\text{ꠘ}$  *tapannang* ‘we are thirsty’ on the other.

Just as  $\text{ꠘ}$  *nay* expresses *conjunction*,  $\text{ꠘ}$  *soyang* ‘or’ expresses *disjunction*. It is equally placed between two disjuncts and equally works at all levels—lexical heads, phrases, and clauses. Inclusive and exclusive ‘or’ are not formally distinguished in Ayeri by the disjunction  $\text{ꠘ}$  *soyang* alone, so context is necessary to contrast between them. Alternatively, a construction akin to English ‘either ... or’ may be used to make the distinction explicit (see section 4.8.2).

- (252) a. *Pasyyang*,    *yāng*     $[\text{AP}[\text{A } \text{mino}] \text{ } \text{soyang} \text{ } [\text{A } \text{giday}]]$ .  
   pasy=yang    yāng           mino   soyang   giday  
   wonder=1SG.A   3SG.M.A   happy   or       sad  
           ‘I wonder whether he is happy or sad.’
- b. *Le*    *no*    *ginvāng*     $[\text{NP } \text{karon}] \text{ } \text{soyang} \text{ } [\text{NP } \text{gali}]$  ?  
   le     no     gin=vāng       karon-Ø   soyang   gali-Ø  
   PT.INAN   want   drink=2SG.A   water-TOP   or       juice-TOP  
           ‘Do you want to drink water or juice?’

- c. [<sup>s</sup>Beratu edauyi] soyang [<sup>s</sup>sa-sahu rangya ]!  
 berata-u edauyi soyang sa~saha-u rang-ya  
 decide-IMP now or return-IMP home-LOC  
 ‘Decide now or go home!’

As above, (252) shows different syntactic contexts for *soyang*. In (252a), two adjectives, *mino* ‘happy’ and *giday* ‘sad’ are put in opposition as phrasal heads making up a predicative AP. Then, in (252b), the choice is between two NPs, *le ... karon* ‘water’ and *le ... gali* ‘juice’, which jointly form the object of *ginvāng* ‘you drink’. Lastly, in (252c), two main clauses are in opposition—either disjunct forms a complete sentence on its own.

#### 4.8.2 Complex conjunction and disjunction

English has a number of correlative conjunctions, that is, conjunctions made up of multiple parts which work together as one expression. Among these are, notably, *as ... as*, *both ... and*, *either ... or*, *neither ... nor*, *rather ... than*, and *the ... the*. Ayeri uses the adverb *kamo* ‘equally, same’ together with a conjunction for many of these.

*kamo ... nay* ‘equally ... and’ is equivalent to ‘both ... and’: the correlative construction emphasizes that two options are equal to each other. Syntactically, resulting sentences are equal to those presented in (251). *sano* ‘both’ may be used as a synonym to *kamo* as well here.

- (253) *Ang vacay kamo piyuley nay obanley.*  
 ang vac=ay.Ø kamo piyu-ley nay oban-ley  
 AT like=ISG.TOP equally grain-P.INAN and bean-P.INAN  
 ‘I like both grains and beans.’

Alternatively, it is possible to use a construction with *naynay* ‘(and) also’:

- (254) *Ang vacay piyuley, obanley naynay.*  
 ang vac=ay.Ø piyu-ley oban-ley naynay  
 AT like=ISG.TOP grain-P.INAN bean-P.INAN also  
 ‘I like grains and also beans.’

The example in (253) may be translated more literally as ‘I like grains and beans equally’, with two NPs in alternation, both being objects of a transitive verb, *vac-* ‘like’. With predicative adjectives, the verb *kama-* ‘(be) equal’ may be used:

- (255) *Ang kamayan mabo nay giday.*  
 ang kama=yan.Ø mabo nay giday  
 AT be.equal=3PL.M.TOP hungry and thirsty  
 ‘They are both hungry and thirsty.’

ꨀꨣ: *kama-* is one of Ayeri’s copular verbs used to express equality between two properties of its subject. The literal meaning of (255) is thus, roughly, ‘They are as hungry as they are thirsty’. The construction slightly differs from that used to do comparison of NPs, however, in that the conjunction ꨀꨣ *nay* is placed between both predicative terms here. In order to express literal ‘be ... as ... as’, thus, the conjunction is dropped:

- (256) *Kamareng matikan belanas agonanya.*  
 kama=reng matikan helan-as agonan-ya  
 be.equal=3SG.INAN.A hot oven-P outside-LOC  
 ‘It’s as hot as an oven outside.’

ꨀꨣ—ꨀꨣ *kamo ... nay* is used to express ‘the ... the’, that is, a proportional or antiproportional relationship between two amounts, sizes, or properties; using ꨀꨣ *sano* ‘both’ here is judged less fitting. In order to express a relationship of equal increase/decrease in this way, conjuncts are additionally marked with the comparative suffix ꨀꨣ *-eng* ‘more, rather’ or its opposite, ꨀꨣ *-ikoy* ‘less’:

- (257) *Ang tavyan kamo nakēng nay konjāng-eng.*  
 ang tav=yan.Ø equal naked-eng nay kond=yāng=eng  
 AT become=3SG.M.TOP equally tall-COMP and eat=3SG.M.A=more  
 ‘The taller they get, the more they eat.’

The type of correlative conjunction which selects one of two alternatives but not both—that is, exclusive ‘or’ (XOR)—is expressed by the construction ꨀꨣ—ꨀꨣ *kamo ... soyang* ‘equally ... or’, as illustrated by (258).<sup>48</sup> For its negative opposite, ‘neither ... nor’, negation must be used, which is displayed in (259).

<sup>48</sup> Interestingly, it looks as though I slightly plagiarized English here in idea, albeit unwittingly: the etymology of *either* is given as being from Old English *ēghwæðer*, *ēgðer*, from Germanic *\*aiwon* ‘always’ + *\*gihwafaro-z* ‘each of two’, cf. OED (2016: *either*, adj. (and pron.) and adv. (and conj.)). On the other hand, the collective wisdom of the internet’s fictional-language community holds that one cannot truly innovate grammatical structures; there will always be a natural language which evolved a given construction before, and possibly with more complications involved. This situation is referred to as ‘ANADEW’, an acronym for ‘a nat[ural] lang[uage] already dunnit except worse’ (Teoh 2003).

- (258) a. *Ang miraya kamo Ajān adaley eda-konkyanya soyang da-mararya.*  
 ang mira-ya kamo Ajān adaley eda=konkyan-ya soynag da=mararya  
 AT do-3SG.M equally Ajān that-P.INAN this=month-LOC or such-next  
 ‘Ajān does it either this month or next.’
- b. *Kamayong mabo soyang krito mirampaluy.*  
 kama=yong mabo soyang krito mirampaluy  
 be.equal=3SG.N.A hungry or angry otherwise  
 ‘They are either hungry or otherwise angry.’
- (259) a. *Ang taboyye kamo Sipra netuas soyang kinās.*  
 ang taha-oy-ye kamo Ø Sipra netu-as soyang kinās  
 AT have-NEG-3SG.F equally TOP Sipra brother-P or sister-P  
 ‘Sipra has neither a brother nor a sister.’
- b. *Ang kamuay layas soyang veno.*  
 ang kama-oy=ay.Ø lay-as soyang veno  
 AT be.equal-NEG=1SG.A girl-P or beautiful  
 ‘I am neither a girl nor beautiful.’

## 5 Phrase structures

---

While the previous chapter dealt largely with the various parts of speech and their various distributive and inflectional properties, the present chapter will elaborate on how these words combine into syntactic phrases.<sup>1</sup> Since Ayeri is a verb-initial language, it is probably most comfortably analyzed in terms of Lexical-Functional Grammar (Bresnan 1982 ff.; more recently Bresnan et al. 2016; Dalrymple 2001), since LFG does not require complicated derivations behind the surface structure of sentences.<sup>2</sup> It will be assumed here that, even though Ayeri is basically VSO with predicate and predication not adjacent to each other, it is configurational in that there is a VP which c-commands a number of other constituents as complements in transitive sentences.

In principle, LFG assumes that grammar operates on different structural levels: mainly, these are a(rgument) structure, c(onstituent) structure, and f(unctional) structure; other layers have been proposed by different researchers for different purposes (Butt and King 2015: 862–865). Bresnan et al. (2016) define three core design principles for LFG:

**Variability:** “The principle of variability states that *external structures vary across languages*. The formal model of external structure in LFG is the *c-structure*, which stands for ‘constituent structure’ or ‘categorical structure” (41). C-structures are commonly represented by context-free phrase-structure rules; constituency trees are based on an extended version of X-bar theory (42).<sup>3</sup>

<sup>1</sup> It should be noted that, since trees are large, a number of regularly numbered examples in this chapter will appear not in place but floated, like tables and figures in the previous chapters.

<sup>2</sup> Passivization, for instance, is assumed to be a lexically motivated alternation in predicate structure (SUBJ is prohibited, so the nominative is assigned to OBJ, and the original SUBJ is expressed by an ADJ), rather than an internal derivational process (Bresnan et al. 2016: 23 ff.).

<sup>3</sup> The basic recursive rules of X-bar theory are observed:

1.  $XP \rightarrow YP, X'$  (specifier rule)
2.  $X' \rightarrow X', YP$  (adjunct rule)

**Universality:** “The principle of universality states that *internal structures are largely invariant across languages*. The formal model of internal structure in LFG is the *f-structure*, which stands for ‘functional structure’” (Bresnan et al. 2016: 42). The f-structure is depicted as an argument-value matrix (AVM) which maps the relations between ‘subject’ (SUBJ), ‘object’ (OBJ), ‘predicator’ (PRED), etc. as functional abstractions of NP, VP, V, etc. (42). Verbs are also presented with their *a-structure* spelled out. That is, which arguments a verb has relations to is formally stated (15). The f-structure collates semantic features associated with heads of grammatical functions (GFs), such as case (CASE), person (PERS), number (NUM), which are abstract features and as such need not have morphological realization (43).

**Monotonicity:** “Constituent structure form is simply not the same in all languages [...] In LFG the correspondence mapping between internal and external structures does not preserve sameness of form. Instead, *it is designed to preserve inclusion relations between the information expressed by the external structure and the content of the internal structure*” (43). Due to the principle of monorepresentation, information distributed over different morphemes which logically belongs to a single grammatical function is presented in the f-structure as unified.

To illustrate the different parallel structures in operation, Bresnan et al. (2016: 15) give the schema in Figure 5.1 to demonstrate which part of the a- and c-structure respectively corresponds (‘links’, ‘maps’) to which part of the f-structure. Regarding the different functions distinguished, LFG assumes the following hierarchies (97, 100):

- (1) a. Grammatical functions (GFs):  

$$\overbrace{\text{SUBJ} > \text{OBJ} > \text{OBJ}_\theta}^{\text{core}} > \overbrace{\text{OBL}_\theta > \text{XCOMP}, \text{COMP} > \text{ADJ}}^{\text{noncore}}$$
 b. (Non)argument functions (AFS/ $\overline{\text{AF}}$ s):  

$$\underbrace{\text{TOP FOC}}_{\text{non-a-fns}} \overbrace{\text{SUBJ OBJ OBJ}_\theta \text{OBL}_\theta \text{XCOMP COMP}}^{\text{a-fns}} \underbrace{\text{ADJ}}_{\text{non-a-fns}}$$
 c. Discourse functions (DFS):  

$$\overbrace{\text{TOP FOC SUBJ}}^{\text{d-fns}} \underbrace{\text{OBJ OBJ}_\theta \text{OBL}_\theta \text{XCOMP COMP ADJ}}_{\text{non-d-fns}}$$

3.  $X' \rightarrow X^0, YP$  (complement rule)

The principle of economy of expression furthermore dictates that essentially, trees be pruned of empty terminal nodes and non-branching preterminal nodes, since these do not provide structurally or semantically relevant information (Bresnan et al. 2016: 119–128).

Figure 5.1: F-structure mappings (Bresnan et al. 2016: 15)

The elements listed in (1) will also appear in phrase-structure rules and c-structure trees together with arrows. These arrows symbolize inheritance of feature information from the current level ( $\downarrow$ ) of the tree to the next ( $\uparrow$ ), so for instance,  $\langle \uparrow \text{SUBJ} \rangle = \downarrow$  means that the information subsumed by the current node ('down') is passed on as the subject function of the next higher node ('up') in the tree. Concise information on notational formalisms of LFG can be found, for instance, in Butt and King (2015).

## 5.1 Noun and determiner phrases

Noun phrases (NPs), and determiner phrases (DPs) as their functional counterpart, fulfill the functions of subject (SUBJ), object (OBJ), secondary object ( $\text{OBJ}_\theta$ ), as well as various oblique constituents ( $\text{OBL}_\theta$ ; see (2) below), and they can also form adjuncts (ADJ). DPs and NPs can also constitute topics (TOP). Which DP or NP receives which function is selected by the a-structure of the verb—this also has repercussions on case- and topic marking.

Since the constituent containing the various non-verbal elements in Ayeri is likely exocentric and constituents may move around within it in a restricted way, we have to assume that not constituent structure, but case marking identifies the grammatical functions of the various arguments of verbs. Thus, the following lex-icocentric conditions operate on both DP and NP as exponents of case:

- (2) a.  $(\downarrow \text{ CASE}) = \text{A} \implies (\uparrow \text{ SUBJ}) = \downarrow$   
 b.  $(\downarrow \text{ CASE}) = \text{P} \implies (\uparrow \text{ OBJ}) = \downarrow$   
 c.  $(\downarrow \text{ CASE}) = \text{DAT} \implies (\uparrow \text{ OBJ}_\theta) = \downarrow \text{ OR } (\uparrow \text{ PCASE}) = \text{OBL}_{\text{goal}}$   
 d.  $(\downarrow \text{ CASE}) = \text{GEN} \implies (\uparrow \text{ POSS}) = \downarrow \text{ OR } (\uparrow \text{ PCASE}) = \text{OBL}_{\text{src}}$   
 e.  $(\downarrow \text{ CASE}) = \text{LOC} \implies (\uparrow \text{ OBL}_{\text{loc}}) = \downarrow \text{ OR } (\uparrow \text{ PCASE}) = \text{OBL}_{\text{loc}}$   
 f.  $(\downarrow \text{ CASE}) = \text{CAUS} \implies (\uparrow \text{ OBL}_{\text{caus}}) = \downarrow$   
 g.  $(\downarrow \text{ CASE}) = \text{INS} \implies (\uparrow \text{ OBL}_{\text{ins}}) = \downarrow$

The rules in (2) determine the typical mappings between case marking and grammatical functions, which are not always unambiguous. As explained above (compare section 4.1.3), the dative case does not only indicate that something is done to this referent or to their benefit, but it may also indicate motion towards this referent. Likewise, the genitive case does not only indicate possession, but also origin, and motion from this referent. Nominal adjuncts to nouns which specify what the noun consists also appear in the instrumental case, besides the instrumental being used to indicate the means or the circumstance by which an action comes about. Moreover, DPs or NPs may also lack case marking, which indicates that the respective phrase is a part of the topic of the verb, which is what (3) describes:

- (3)  $\neg(\downarrow \text{ CASE}) \implies \downarrow \in (\uparrow \text{ TOP})$

Instead of case marking on the DP or NP, there is a marker in front of the verb which provides information on the case and, if AT or PT, also about the animacy of the topicalized phrase. This means that grammatical information about the topic of a phrase is spread over two discontinuous locations. This issue does not pose a problem to an LFG-based analysis, however, since both locations unify their information content in the f-structure feature TOP. Since information located in multiple places is jointly feeding this feature, I am using the annotation ' $\downarrow \in (\uparrow \text{ TOP})$ ' for each location rather than simple ' $(\uparrow \text{ TOP}) = \downarrow$ '. Note that only one NP among the arguments of a verb may be the topic of the phrase, and a topic can only be marked if the verb is finite and the number of arguments to the verb is greater than one.

### 5.1.1 Noun phrases

#### *Constituent order within noun phrases*

Nouns are one of the main parts of speech of Ayeri, and nouns can be modified by a number of other free elements, as we have seen previously—adjectives, possessive adjectives, as well as relative clauses and nominal adjuncts. These typically follow nouns. It was also described before that Ayeri's nouns may host a number of clitics, among which are deictic prefixes and quantifiers, as well as enclitic case markers in the case of proper nouns. These clitics, however, will not be treated as targets

of syntactic operations, since LFG follows the approach of lexical integrity. Thus, bound elements like affixes and clitics are assumed not to be reflected or affected by syntax itself. The phrase structure of NPs should thus look like depicted in (4). The asterisk in (4d) is the Kleene star and indicates zero or more instances of the element. Elements which may occur zero or once are in brackets.

- (4) a.  $NP \rightarrow \begin{matrix} N' \\ \uparrow = \downarrow \end{matrix}$
- b.  $N' \rightarrow \begin{matrix} N' \\ \uparrow = \downarrow \end{matrix} \left( \begin{matrix} CP \\ (\uparrow \text{ COMP}) = \downarrow \end{matrix} \right)$
- c.  $N' \rightarrow \begin{matrix} N' \\ \uparrow = \downarrow \end{matrix} \left( \begin{matrix} \{NP \mid DP\} \\ (\uparrow \text{ POSS}) = \downarrow \end{matrix} \right)$
- d.  $N' \rightarrow \begin{matrix} N' & AP^* \\ \uparrow = \downarrow & \downarrow \in (\uparrow \text{ ADJ}) \end{matrix}$
- e.  $N' \rightarrow \begin{matrix} N' \\ \uparrow = \downarrow \end{matrix} \left( \begin{matrix} NP \\ (\uparrow \text{ XCOMP}) = \downarrow \end{matrix} \right)$

This rule defines that NPs have a lexical head which is on the left side, followed optionally by modifiers which may have various relationships to the noun: complement (instrumental nominal, NP/DP), adjunct (adjective phrase, AP), possessor (genitive NP/DP), relative clause (forming a complementizer phrase, CP). This can be represented as a constituent-structure tree in the way described in (5).

Here as well, we can see a nominal head on the left which may be modified by phrases of various types. The maximal projection of  $N^0$  (that is, NP) is annotated very generally for the function of the NP—basically, an NP can act as either a discourse function (DF) or a grammatical function (GF). (6) gives an example of each kind of modifier. Since there is no grammatical context given, NP is unmarked for function in these examples.

- (6) a. noun + adjective:

*ningan hiro*  
 ningan hiro  
 story new  
 ‘new story’

- b. noun + possessor:

*kegan ayonena*  
 kegan ayon-ena  
 hat man-GEN  
 ‘the man’s hat’

- c. noun + instrumental complement:

*kasu bariri*  
 kasu bari-ri  
 basket meat-INS  
 ‘basket of meat’

- d. noun + relative clause:

*nanga si incāṅg*  
 nanga si int=yāṅg  
 house REL buy=3SG.M.A  
 ‘the house he bought’

As described before (compare section 3.2.5), nouns can be modified by a number of clitics which are not represented through syntax. Since it is not possible for these clitic elements to be divided from their phonological hosts, they should be treated as being an integral part of the word they attach to. Hence, N<sup>0</sup> is given in (7) as split into ‘Cl’ and N<sup>0</sup>.

- (7) a. noun + deictic prefix:

*eda- nanga*  
 eda= nanga  
 this=house  
 ‘this house’

- b. noun + quantifier:

*nangās -ikan*  
 nanga-as=ikan  
 house-P =many  
 ‘many houses’

- c. proper noun + case:

*ang Diyan*  
 ang=Diyan  
 A= Diyan  
 ‘Diyan’

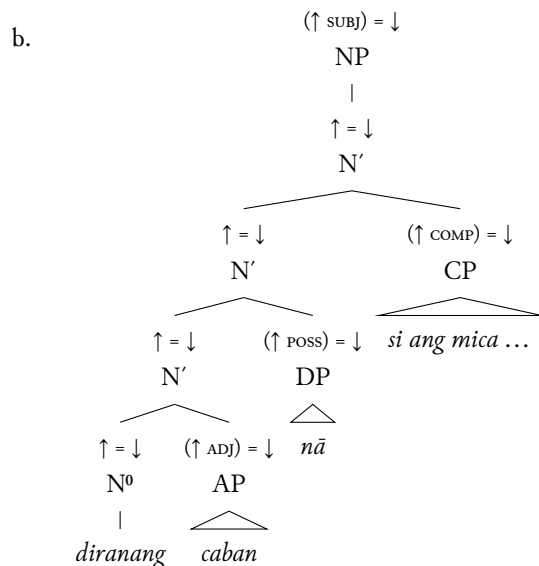

Of course, it is also possible to combine these nominal modifiers. In this case, there is a certain hierarchy, presumably based on Behaghel’s first law, “Das oberste Gesetz ist dieses, daß das geistig eng Zusammengehörige auch eng zusammengestellt wird” (Behaghel 1932: 4; ‘The supreme law is such that the mentally

closely related is also arranged in close proximity.’), and also grammatical weight (Wasow 1997):

1. instrumental NP indicating what the head consists of,
2. APs (also cardinals) and other NPs describing attributes,
3. possessive genitive NPs,
4. relative clauses.

Wasow (1997) writes that “[i]t is very hard to distinguish among various structural weight measures as predictors of weight effects. Counting words, nodes, or phrasal nodes all work well” (102), which means that no single metric can be used to describe the order of constituents in a phrase. However, for instance, relative clauses trail whenever possible presumably since they tend to contain whole sub-clauses and thus a lot of information. It seems advisable not to put an element with much less information content after them, especially when it refers to a different head than all the things inside the relative clause. The following example (8) illustrates the unmarked order of modifiers.

- (8) a. *diranang caban nā si ang mica ya Kārvisam*  
 diran-ang caban nā si ang mit=ya.Ø ya= Kārvisam  
 uncle-A favorite ISG.GEN REL AT live=3SG.M.TOP LOC=Kārvisam  
 ‘my favorite uncle who lives in Kārvisam’

As the c-structure tree in (8) shows, Ayeri prefers head-dependent word order with exceeding consistency. As illustrated by previous examples, both adjuncts and complements are, for the most part, consistently appended to the right of their

heads, which means that Ayeri may be classified as a rather consistently right-branching language. However, a certain number of postpositions form an exception to this classification (section 4.4.2). In the light of word order typology, we can formulate the following generalizations:

- (9) a. Order of noun and adjective: N Adj
- b. Order of noun and genitive: N Gen
- c. Order of noun and relative clause: N Rel

More important to LFG than c-structure trees, however, are function-structure matrices which gather all information in a given utterance and gather potentially disparate information into semantically coherent units within the matrix.<sup>4</sup> In the following, I will thus give a list of morpholexic specifications which give an overview of the different semantic and morphological features nouns basically provide (also compare section 4.1). These also form the basis for f-structure matrices of the kind already shown in (64), section 3.2.5, p. 91.

- (10) ...           N           (↑ PRED)   =   ‘...’
- (↑ ANIM)   =   ±
- (↑ CASE)   =   {A, P, DAT, GEN, LOC, INS, CAUS}
- (↑ GEND)   =   {M, F, N, INAN}
- (↑ NUM)   =   {SG, PL}
- (↑ PERS)   =   3

Nouns generally imply a third-person reference; they distinguish number, gender and animacy, as well as case. Clitics, however, may also add information about deixis (11); likeness and quantity might be interpreted conveniently as adding to the list of a noun’s ADJ feature (12).

- (11)                           (↑ DEIX)   =   {*this, that, such*}

- (12) a.   *ganang-hen   mino*  
          *gan-ang=hen   mino*  
          *child-A=all    happy*  
          ‘all happy children’

<sup>4</sup> Essentially, c-structure is similar to the tree hierarchy of paragraphs, images, tables etc. in an HTML file, while f-structure describes semantic properties of elements in the tree similar to how CSS defines the layout properties of these elements.

$$b. \left[ \begin{array}{c} \text{SUBJ} \\ \left[ \begin{array}{c} \text{PRED 'child'} \\ \text{ANIM } + \\ \text{CASE } A \\ \text{ADJ } \left\{ \begin{array}{c} \left[ \text{PRED 'all'} \right], \\ \left[ \text{PRED 'happy'} \right] \end{array} \right\} \end{array} \right] \end{array} \right]$$

### Morphosyntactic operations within the noun phrase

It has been pointed out above that nouns encode animacy. This has repercussions in the choice of case markers of the agent and patient cases, which need to agree with the lexical head they attach to. An example of this is given in (13).

Example (13a) shows a well-formed construction: the noun,  $\text{gan}$  ‘child’, is animate, hence the case particle also needs to be animate—the case particle must thus be  $-\text{ang}$  to be coherent. In contrast to this, example (13b) is not well-formed in that the noun is animate but the case particle,  $-\text{reng}$ , signals that it is inanimate: the ANIM values of the noun stem and its suffix clash and cannot be conclusively unified for  $N^0$  itself. The same principle of coherence is, of course, also true for proper nouns, which receive a case-marking particle:

Furthermore, example (12) already showed that nouns may be modified by quantifiers, whether these are clitic suffixes (section 4.6.2) or numerals (section 4.7). In these cases, plural marking on the noun is suppressed by the presence of the modifier which supplies the information by itself so that further morphological plural marking by the suffix  $\text{ႤႬ}$  *-ye* on the noun stem itself would be redundant. As shown in section 4.7 (p. 226), however, there are very limited occasions where a noun may be marked for plural in spite of the presence of a numeral, for instance:

- (15) *Ang bengyon keynamye menang kanānya desay iray.*  
 ang beng-yon keynam-ye-Ø menang kanān-ya desay iray  
 AT attend-3PL.N people-PL-TOP hundred wedding-LOC royal

‘Hundreds of people attended the royal wedding.’

Here, the noun  $\text{ႤႬႬ}$  *keynam* ‘people’ is marked additionally for plural by the nominal plural suffix  $\text{ႤႬ}$  *-ye* in spite of being a *plurale tantum* and in spite of the presence of the numeral  $\text{ႤႬႬ}$  *menang* hundred. Without plural morphology, the meaning of  $\text{ႤႬႬႤႬႬ}$  *keynam menang* would be ‘a hundred people’, not generic ‘hundreds’.

### 5.1.2 Determiner phrases

Determiner phrases (DPs) are the functional equivalent of NPs; determiners as their heads ( $D^0$ ) are a closed class of function words (Bresnan et al. 2016: 102). In English, for instance, articles and pronouns are counted among them (Carnie 2013: 208–211). Ayeri, however, probably does not possess articles as such. The preposed case markers of proper nouns bear a superficial similarity to cased articles like in German (16) and the suffixed case markers look superficially similar to suffixed articles in Romanian (17). The presence or absence of case markers in Ayeri is moreover morphosyntactically controlled by topicalization and thus also interacts with definiteness. However, as we will see below, the distribution of these case particles differs from that of articles in languages like English or German.

- (16) a. A *ang Sān* ‘Sān’  
 P *sa Sān* ‘Sān’  
 DAT *yam Sān* ‘to Sān’  
 GEN *na Sān* ‘Sān’s’  
 LOC *ya Sān* ‘at Sān’  
 CAUS *sā Sān* ‘due to Sān’  
 INS *ri Sān* ‘with/by Sān’
- b. German:  
 NOM.SG *der Mann* ‘the man’  
 ACC.SG *den Mann* ‘the man’  
 DAT.SG *dem Mann* ‘to the man’  
 GEN.SG *des Mannes* ‘of the man’

- (17) a.
- |      |               |                       |
|------|---------------|-----------------------|
| A    | <i>ganang</i> | 'a/the child'         |
| P    | <i>ganas</i>  | 'a/the child'         |
| DAT  | <i>ganyam</i> | 'to a/the child'      |
| GEN  | <i>ganena</i> | 'of a/the child'      |
| LOC  | <i>ganya</i>  | 'at a/the child'      |
| CAUS | <i>ganisa</i> | 'due to a/the child'  |
| INS  | <i>ganeri</i> | 'with/by a/the child' |
- b. Romanian (adapted from Lyons 1999: 75):
- |        |                 |             |
|--------|-----------------|-------------|
| PRI.SG | <i>cartea</i>   | 'the book'  |
| OBL.SG | <i>cărții</i>   | 'the book'  |
| PRI.PL | <i>cărțile</i>  | 'the books' |
| OBL.PL | <i>cărților</i> | 'the books' |

While in German an article and a demonstrative pronoun, or also a possessive pronoun, cannot co-occur, this appears not to be a problem in Ayeri. As argued in section 3.2.5, both case markers and deictic/demonstrative prefixes in Ayeri are clitics; the similarity between possessive pronouns and adjectives has also been noted in section 4.2.1 (p. 147). Furthermore, the preposed case markers of nouns are an exception compared to the much more frequent occurrence of case-marking suffixes on generic nouns. It thus does not seem straightforward to analyze the case markers as heads of DPs.

- (18) a. German:
- |              |             |
|--------------|-------------|
| <i>das</i>   | <i>Haus</i> |
| das          | Haus        |
| DEF.NOM.SG.N | house       |
| 'the house'  |             |
- b.
- |                  |             |
|------------------|-------------|
| <i>dieses</i>    | <i>Haus</i> |
| dies-es          | Haus        |
| this-NOM.SG.N.ST | Haus        |
| 'this house'     |             |
- c.
- |                     |             |
|---------------------|-------------|
| <i>mein</i>         | <i>Haus</i> |
| mein-Ø              | Haus        |
| 1SG.GEN-NOM.SG.N.ST | house       |
| 'my house'          |             |
- d. \**das*      *diese*      *Haus*
- |                  |                  |       |
|------------------|------------------|-------|
| das              | dies-e           | Haus  |
| DEF.NOM.SG.N     | this-NOM.SG.N.WK | house |
| 'the this house' |                  |       |

- e. \**das*                    *meine*                    *Haus*  
       *das*                    *mein-e*                    *Haus*  
       DEF.NOM.SG.N    ISG.GEN-NOM.SG.N.WK    house  
       ‘the my house’
- f. \**dieses*                    *meine*                    *Haus*  
       *dies-es*                    *mein-e*                    *Haus*  
       this-NOM.SG.N.ST    ISG.GEN-NOM.SG.N.WK    house  
       ‘this my house’
- g. #*dieses*                    *mein*                    *Haus*  
       *dies-es*                    *mein-Ø*                    *Haus*  
       this-NOM.SG.N.ST    ISG.GEN-NOM.SG.N.ST    house  
       ‘this house of mine’

The examples in (18) show that determining elements such as a definite article (*der* ‘the’), a demonstrative pronoun (*dieser* ‘this’) and a possessive pronoun (*mein* ‘my’) are in complementary distribution for some combinations. The only exception to this is the combination of demonstrative and possessive in (18g), which is grammatically marked, however.<sup>5</sup> On this phenomenon of complementary distribution of determiners, which also holds true for English, Carnie (2013: 208) writes, “One thing to note about determiners is that they are typically heads. Normally, there can only be one of them in an NP,” at least in English (and German). Demske (2001: 9–22) elaborates on this point for German as well. Regarding the examples in (17b), Dindelegan (2013) states about Romanian that

Prenominal demonstrative [*sic*] take a determinerless (articleless) head-noun complement [...] while postnominal demonstratives obligatorily occur in DPs with article-bearing noun heads [...] The postnominal construction is thus a polydefinite structure, since definiteness is realized twice [...], by the article and by the demonstrative. (297)

Dindelegan (2013: 297) gives the following examples for these two placement variants (glosses extended based on further information in the grammar):<sup>6</sup>

<sup>5</sup> Example (18f) differs from (18g) in the declension paradigm of the adjective: (18f) uses the ‘weak’ (WK) declension regularly, since a determiner with strong (ST) declension precedes. (18g) appears to be an exception in permitting two determiners of the strong declension. Demske (2001: 160–161, 203–205) notes that, according to Plank (1992), possessive pronouns may apparently still act as modifiers, not only determiners, under certain circumstances. In modern Standard German, this construction is strongly marked, however. It is probably a remnant of earlier stages of German where there was no such restriction on the co-occurrence of demonstrative and possessive pronouns yet (Demske 2001: 173).

<sup>6</sup> In declension charts, Dindelegan (2013) indicates the cases as ‘NOM ≡ ACC’ and ‘DAT ≡ GEN’ where Lyons (1999) uses PRI and OBL.

- (19) a. *acest* *om* [Romanian]  
 acest-Ø om-Ø  
 this-NOM+ACC.SG.M man-SG  
 ‘this man’
- b. *omul* *acesta*  
 om-ul acest-a  
 man-DEF.NOM+ACC.SG.M this-NOM+ACC.SG.M  
 ‘this man’

Ayeri, however, behaves differently than either German or Romanian in treating case markers and demonstrative elements as clitics. The case marker is always present for untopicalized NPs, whether there is modification by a demonstrative clitic or not. The demonstrative clitic merges with the head noun to the point where it is not certain whether it is still a clitic or already an inflectional prefix (section 3.2.5), that is, they do not have phrasal status like the postnominal determiners of Romanian, but they are not heads of DP like the prenominal determiners of Romanian either (Dindelegan 2013: 299), due to their status as clitics.

- (20) a. *ang Săn*  
 ang=Săn  
 A= Săn  
 ‘Săn’
- b. *ang eda- Săn*  
 ang=eda= Săn  
 A= this=Săn  
 ‘this Săn’
- c. *ang Săn nă*  
 ang=Săn nă  
 A= Săn ISG.GEN  
 ‘my Săn’
- d. <sup>?</sup>*ang eda- Săn nă*  
 ang=eda= Săn nă  
 A= this=Săn nă  
 ‘this Săn of mine’

In all cases listed in (20), the case marker is present and marks the NP simply for agent case, irrespective of other elements. Characteristically, neither the demonstrative prefixes, nor the possessive pronoun/adjective in Ayeri mark case, while they do in German. The case marker thus cannot be simply left out, because the information it provides is not redundant, strictly speaking. Where it *is* left

out, it marks the NP as topicalized and it is required, then, that the verb mark the topicalized NP's case. The same is also true of generic nouns:

- (21) a. *veneyang*  
veney-ang  
dog-A  
'a/the dog'
- b. *eda- veneyang*  
eda= veney-ang  
this=dog-A  
'this dog'
- c. *veneyang nā*  
veney-ang nā  
dog-A ISG.GEN  
'my dog'
- d. *eda- veneyang nā*  
eda= veney-ang nā  
this=dog-A ISG.GEN  
'this dog of mine'

While it has been argued that Ayeri does not possess articles, it does possess a large variety of pronouns. These, as pro-forms, appear in complementary distribution with NPs. Since they encode morphosyntactic functions rather than semantic content, they are ideal candidates for heads of DP. DPs can be modified by those phrases which can modify nouns as well: NPs, APs and CPs, collectively referred to as XP below. The phrase structure of DPs should thus look as illustrated in (22) and (23). The XP constituent is in brackets in both cases since it is optional, that is, it is an adjunct rather than a complement. The functional annotation identifies it as such.

- (22) a.  $DP \rightarrow \begin{matrix} D' \\ \uparrow = \downarrow \end{matrix}$
- b.  $D' \rightarrow \begin{matrix} D^0 \\ \uparrow = \downarrow \end{matrix} \left( \begin{matrix} XP \\ \downarrow \in (\uparrow_{ADJ}) \end{matrix} \right)$

### Personal pronouns

The morpholexic specifications for personal pronouns are given in (24). Personal pronouns, as a functional category, are a closed class of words; the chart of personal pronouns in Ayeri is given in section 4.2.1. Since personal pronouns are pro-forms, they do not have lexical content for a predicator, but only ‘*pro*’. Pronouns distinguish all grammatical categories of nouns—number, gender and animacy, and case; they agree with their antecedents in number, gender, and animacy. In addition to these person features, pronouns of course also encode person as a deictic category. The reflexive clitic  $\text{ṣṭang}$ : *sitang*- also redefines the personal pronoun as reflexive.

(24)	...	N	( $\uparrow$ PRED)	=	‘ <i>pro</i> ’
			( $\uparrow$ ANIM)	=	$\pm$
			( $\uparrow$ CASE)	=	{A, P, DAT, GEN, LOC, INS, CAUS}
			( $\uparrow$ GEND)	=	{M, F, N, INAN}
			( $\uparrow$ NUM)	=	{SG, PL}
			( $\uparrow$ PERS)	=	{1, 2, 3}
			(( $\uparrow$ PRONTYPE)	=	REFL)

Personal pronouns, as an exception to the phrase-structure definition in (22), cannot be modified by adjectives and nominal adjuncts, however, they may still be modified by relative clauses as well as clitic quantifiers. Modification by a quantifier clitic is only possible for personal pronouns when they are free morphemes, though; modification of pronominal suffixes by quantifiers is not possible, as described in section 4.2.6—a reflexive particle is needed here to attach the quantifier to. The examples in (25) show what is not possible as compared to nouns.

(25) a. \*pronoun + adjective:

*yāng*    *hiro*  
*yāng*    *hiro*  
 3SG.M.A    new  
 ‘new he’

- b. \*pronoun + possessor:

*reng ayonena*  
*reng ayon-ena*  
 3SG.INAN.A man-GEN  
 ‘the man’s it’

- c. \*pronoun + instrumental complement:

*nang bariri*  
*nang bari-ri*  
 IPL.A meat-INS  
 ‘we of meat’

As mentioned above, it is possible for pronouns to be modified by relative clauses, which is illustrated by (26). In this example, the pronoun *yeng* ‘she’ is modified by the relative clause *si mino* ‘who is happy’.

- (26) pronoun + relative clause:

*yeng si mino*  
*yeng si mino*  
 3SG.F.A REL happy  
 ‘she who is happy’

### Demonstrative pronouns

The morphology of demonstrative pronouns was described in section 4.2.2. In contrast to personal pronouns, demonstrative pronouns do not mark person; a third person reference is implied like with nouns, however. Instead, they mark deixis more generally as location in space. Notably, demonstrative pronouns also lack a number distinction. As previously discussed, Ayeri distinguishes proximal (𐌆𐌿𐌰: *eda-*) and distal (𐌆𐌿𐌰: *ada-*) as well as an indefinite ‘such’ (𐌆𐌿𐌰: *da-*), which is why the feature definitions in (27) list a DEIX feature encoding *this*, *that*, and *such*, rather than a binary PROX or DIST feature.

- (27) ... N
- |          |   |   |
|----------|---|---|
| (↑ PRED) | = | ‘ <i>pro</i> ’                              |
| (↑ DEIX) | = | { <i>this</i> , <i>that</i> , <i>such</i> } |
| (↑ PERS) | = | 3   |
| (↑ ANIM) | = | ±   |
| (↑ CASE) | = | {A, P, DAT, GEN, LOC, INS, CAUS}            |

Regarding the ability of demonstrative pronouns to be modified, it is necessary to distinguish the proximal 𐌆𐌿𐌰: *eda-* and distal 𐌆𐌿𐌰: *ada-* series from the indefinite

└: *da*-series.<sup>7</sup> The issue at hand here is that the proximal and distal demonstrative pronouns proper are not usually modified, while the indefinite one can be, as demonstrated in section 4.2.2; example (101b) from this section is repeated here as (28c) for convenience:

- (28) a. <sup>?</sup>*Sa noyang edanya tuvo.*  
           sa no=yang edanya-Ø tuvo  
           PT want=ISG.A this.one-TOP red  
           ‘I want this red one.’
- b. <sup>?</sup>*Sa noyang adanya tuvo.*  
           sa no=yang adanya-Ø tuvo  
           PT want=ISG.A that.one-TOP red  
           ‘I want that red one.’
- c. *Sa noyang danya tuvo.*  
           sa no=yang danya-Ø tuvo  
           PT want=ISG.A such-TOP red  
           ‘I want the red one.’

Related to the ability of indefinite demonstrative pronouns to be modified by adjuncts is also the formation of complex demonstratives which incorporate an adjective, both generic and possessive. To repeat (102) from section 4.2.2 for illustration:

- (29) *Sa noyang da-tuvo.*  
           sa no=yang da=tuvo.Ø  
           PT want=ISG.A such=red.TOP  
           ‘I want the red one.’

It has been argued in section 3.2.5 that └: *da*- in this case is a simple clitic, as it appears in the same position as the full form └<sub>22</sub> *danya*; the result is complex demonstrative form which is inflectable for case. How to represent this in terms of a feature matrix, though? For one, the adjective loses its ability to carry comparison morphology (whether it is interpreted as inflectional or clitic) when being incorporated into a demonstrative form, so it is not possible to say (30a) and the effective meaning of (30b) differs from what is intended, since -ər -*vā* is interpreted in its regular, non-grammaticalized meaning here. Thus, in these cases, the demonstrative must be used in the full form (30c).

<sup>7</sup> Based on the absence of evidence for languages which merge *that* and *such*, Lyons (1999: 152) concludes that demonstratives are inherently definite, that is, he apparently refutes the idea that *such* is an ‘indefinite demonstrative’. However, he does not make any suggestions for a better term, which is why I will keep ‘indefinite’ here.

- (30) a. \**da-tuvo-vāas*  
           da=tuvo=vā-as  
           one=red=SUPL-P  
           Intended: ‘the reddest one’
- b. <sup>!</sup>*da-tuvoas-vā*  
           da=tuvo-as=vā  
           one=red-P=most/\*SUPL  
           ‘most red ones’  
           Intended: ‘the reddest one’
- c. *danyās*      *tuvo-vā*  
           danya-as      tuvo=vā  
           that.one-P    red=SUPL  
           ‘the reddest one’

The form with the incorporated adjective is basically the same as that of a noun modified by  $\downarrow$ : *da-*, so it was assumed previously that the proclitic essentially acts as a nominalizer for the adjective. This could also explain why the adjective forfeits its ability to undergo comparison: comparison is not a morphological operation available to nouns, and the comparison morphemes are still loose enough to not jointly undergo derivation to a noun together with the root adjective in the way it is possible, for example, in German to form the deadjectival nouns *das Große* ‘what is big/great’ (for instance, *im Großen* ‘on a large scale’) and *das Größte* ‘the greatest thing’ from the adjective *groß* ‘big, large, great’ and its superlative form *größt-* ‘biggest, greatest’; the superlative suffix being *-(e)st*. Both c- and f-structure should thus look different for the unincorporated and the incorporated adjective, respectively. Example (31) illustrates what the c- and f-structure for the unincorporated adjective looks like.

- (31) a.  $(\uparrow \text{ OBJ}) = \downarrow$   
           DP  
           |  
            $\uparrow = \downarrow$   
           D'  
           /      \  
            $\uparrow = \downarrow$        $\downarrow \in (\uparrow \text{ ADJ})$   
           D<sup>0</sup>      AP  
           |       $\triangle$   
           *danyās*      *tuvo*
- b.  $\left[ \text{OBJ} \left[ \begin{array}{ll} \text{PRED} & \text{'pro'} \\ \text{ANIM} & + \\ \text{CASE} & \text{P} \\ \text{DEIX} & \text{such} \\ \text{ADJ} & \left\{ \left[ \text{PRED} \text{ 'red'} \right] \right\} \end{array} \right] \right]$

The difference between  $\downarrow$  *da-* combined with a noun and the same combined with an adjective is, however, that with a noun, the meaning is ‘such a NOUN’,

while with an adjective the meaning is not ‘such an ADJECTIVE one’, but ‘the ADJECTIVE one’. Thus, the deictic/anaphoric meaning remains, strictly speaking, which is manifest in the fact that the gender of the compound depends on that of the referred-to entity (32). For cases where the noun and the adjective are homophones—like  $\text{tuvo}$  ‘red’—the correct interpretation is dependent on context.

(32) a. CONTEXT: an apple ( $\text{seygo}$ , AN):

... *da-tuvoas*  
da=tuvo-as  
one=red-P.AN

‘... the red one’

b. CONTEXT: a box ( $\text{bin}$ , INAN):

... *da-tuvoley*  
da=tuvo-ley  
one=red-P.INAN

‘... the red one’

If we stay with the analysis that  $\text{da-}$  is a simple clitic and thus equivalent to the full form  $\text{danya}$  (albeit restricted in its use), the assumption stands to reason that the function embodied by  $\text{danya}$  still forms the head of the phrase, so we still have a DP. Since  $\text{da-}$  is no independent word, it cannot be the head of the phrase, so it must not be  $D^0$ . Since there is no other word material for nominal case marking to attach to, the adjective stem is inflected instead of the pronoun. A hypothesis about the structure of  $\text{da-tuvoley}$  is given in (33). This is not unproblematic, though, as we will shortly see.

One question is, whether the *AVM* in this case should look like the one in (31), since now it is the adjective which carries the nominal inflections. Strictly speaking, the functional annotation for the case marker should appear along with the adjective's *PRED* under the *ADJ* relation (33b). Since *LFG* postulates that all semantic information is inherited upwards with an intersection operation applied at each node in a syntactic tree, *DP* will still contain all the relevant information in a consistent manner.

Another question is where in the tree  $\downarrow$  *da-* should appear as a clitic. A lexicalist approach like *LFG* favors would treat  $\downarrow$  *da-tuvoley* as a single unit in terms of syntax. The problem with this is, however, that  $\downarrow$  *da-* encodes ( $\uparrow$  *PRED*) = '*pro*' and the adjective encodes ( $\uparrow$  *PRED*) = '*red*'. Now, if they were both dominated by the same node (*A*<sup>0</sup> in (33a)), that node would have clashing values for *PRED*. This in turn motivates the assumption that  $\downarrow$  *da-* should be represented in the *c*-structure at a higher level than *AP*, that is, adjoined to *D'*. Now it potentially violates lexical integrity, though. One has to wonder if it would be feasible instead to conceptualize  $\downarrow$  *da-tuvoley* as a portmanteau item with two *PRED* values, like (34).

$$(34) \quad * \left[ \begin{array}{c} \text{OBJ} \\ \left[ \begin{array}{cc} \text{PRED} & \left\{ \begin{array}{c} 'pro', \\ 'red' \end{array} \right\} \\ \text{ANIM} & - \\ \text{CASE} & P \\ \text{DEIX} & such \end{array} \right] \end{array} \right]$$

The *AVM* in (34) violates the uniqueness condition, though: “Every attribute has a unique value” (Bresnan et al. 2016: 45), that is, no attribute may have more than one value assigned to it, but we just did this for *PRED* by assigning both '*pro*' and '*red*' to it. Thus, in order not to violate this principle, the question is whether a list of *PRED* attributes (like *ADJ* lists, or whenever coordination is involved) would be acceptable:

$$(35) \quad ? \left[ \begin{array}{c} \text{OBJ} \\ \left[ \begin{array}{c} \left[ \begin{array}{cc} \text{PRED} & 'pro' \\ \text{DEIX} & such \end{array} \right], \\ \left[ \begin{array}{cc} \text{PRED} & 'red' \end{array} \right] \end{array} \right] \\ \text{ANIM} & - \\ \text{CASE} & P \end{array} \right]$$

- (38) a. 
$$\left[ \begin{array}{c} \text{OBJ} \quad f: \left[ \begin{array}{c} \text{PRED} \quad 'pro' \\ \text{ANIM} \quad - \\ \text{CASE} \quad P \\ \text{DEIX} \quad such \\ \text{ADJ} \quad g: \left\{ \left[ \text{PRED} \quad 'red' \right] \right\} \end{array} \right] \end{array} \right]$$
- b.  $\text{da-tuwoley}$       N       $(\uparrow \text{PRED}) = 'red'$   
 $((\text{OBJ} \uparrow) \text{PRED}) = 'pro'$   
 $((\text{OBJ} \uparrow) \text{DEIX}) = such$   
 $((\text{OBJ} \uparrow) \text{CASE}) = P$   
 $(\text{OBJ ADJ} \uparrow)$

Essentially, we can generate the same f-structure as in (31) above this way, since  $\text{da-tuwoley}$  and  $\text{danyaley tuvo}$  should be functionally equivalent in spite of their different morphology. The approach with functional uncertainty permits us, for one, not to violate lexical integrity as in (33a), so the c-structure should more correctly look like in (39). Secondly, we do not have to assume that the adjective itself untypically inflects for case, at least not at a functional level. The case marker just happens to be stuck on it because it is the next best lexical base to attach it to, which is represented in the accompanying c-structure (non-branching bar levels and the empty  $D^0$  have been pruned).

- (39)
- $$\begin{array}{c} (\uparrow \text{OBJ}) = \downarrow \\ \text{DP} \\ | \\ \downarrow \in (\uparrow \text{ADJ}) \\ \text{AP} \\ | \\ \uparrow = \downarrow \\ \text{A}^0 \\ \swarrow \quad \downarrow \quad \searrow \\ \uparrow = \downarrow \quad \uparrow = \downarrow \quad \uparrow = \downarrow \\ \text{Cl} \quad \text{A}_{\text{stem}} \quad \text{A}_{\text{infl}} \\ | \quad | \quad | \\ da- \quad tuvo \quad -ley \end{array}$$

### Interrogative pronouns

Like the other kinds of pronouns, interrogative pronouns are as well a closed class of words in Ayeri. The whole list of them is given in section 4.2.3. Interrogative pronouns, like demonstrative pronouns, only inflect for case, and they distinguish animacy in agreement with their referent. Since interrogative pronouns in Ayeri

do not appear in clause-initial position, but *in situ*, they probably should not be analyzed as heading a CP like in English (Carnie 2013: 359–369; Dalrymple 2001: 405–408), but as heads of DP. The question word ꨀꨁꨂ *sinya* ‘who, what, which (one)’ may also serve as an adjective in cases like (40), however.

- (40) *Ang pretva kunangya sinyā?*  
 ang pret=va.Ø kunang-ya sinyā  
 AT knock=2.TOP door-LOC which  
 ‘Which door did you knock at?’

This case warrants special discussion later, as it differs from the way the majority of interrogative pronouns work. A more canonical example of ꨀꨁꨂ *sinya* in which it acts as a pronoun proper is given in (41).

- (41) *Le tinkaya sinyāng kunang?*  
 le tinka-ya sinyā-ang kunang.Ø  
 PT.INAN open-3SG.M who-A door.TOP  
 ‘Who opened the door?’

Note also that neither ꨀꨁꨂ *sikay* ‘how (means, circumstance)’ nor ꨀꨁꨂ *simin* ‘how (way, procedure)’ can be combined with an adjective to ask about the extent of an attributive property. ꨀꨁꨂ *sikan* ‘how much, how many’ is only used for asking about quantity and cannot combine with adjectives either. Instead, questions like ‘how large’ or ‘how common’ must be phrased using (generic) nouns (42).

- (42) a. *Nabungreng mavayena sinyaley?*  
 nahung-reng mavay-ena sinyā-ley  
 size-A.INAN world-GEN what-P.INAN  
 ‘What is the size of the world?’  
 or: ‘How big is the world?’  
 b. *Adareng vihay apānya sinyā?*  
 ada-reng vihay apān-ya sinyā  
 that-P.INAN common extent-LOC which  
 ‘To what extent is it common?’  
 or: ‘How common is it?’

Logically, what the question word queries for is both the implied object of the question and also new information. That is, what it asks for is the sentence’s focus. For English, Dalrymple (2001: 406) gives the following example:

(43) a. *Who does David like?*

$$b. \quad CP \rightarrow \left( \begin{array}{c} XP \\ (\uparrow \text{ FOC}) = \downarrow \\ (\uparrow \text{ FOC}) = (\uparrow \text{ QFOCUSPATH}) \\ (\uparrow \text{ Q}) = (\uparrow \text{ FOC WHPATH}) \\ (\uparrow \text{ Q PRONTYPE}) =_c \text{ } wh \end{array} \right) \left( \begin{array}{c} C' \\ \uparrow = \downarrow \end{array} \right)$$

The AVM in (43a) indicates that information contained in FOC (as a discourse function) is shared with both the question particle Q and the OBJ of the clause. That is, Q is replacing the OBJ as a pronoun, and as such, embodies the FOC function with the respective properties. The phrase structure in (43b), then, tries to give a formula as general as possible for all question words in English, hence we see XP instead of NP like in example (43a), which is an example of a specific sentence containing the interrogative pronoun *who*. XP corresponds to any phrase type which can contain a question word, that is, NP, PP, AdvP, and AP (Dalrymple 2001: 407). The rather intricate annotation for XP is due to English's fronting of the question word, which necessitates definitions to retrieve the correct corresponding information further down the tree. The annotation basically says that XP is the focus of the clause and specifies that the corresponding information must be found in a location accessible to the *wh*-word (that is, the *wh*-word must c-command it), and there is a requirement that a *wh*-word exist.

Since Ayeri does not front interrogative pronouns like English does, the functional annotations of the phrase structure rule should look a whole lot easier. Yet, however, we still need to account for Q, FOC and its associated GF sharing information. In order to give an example, let us have a look again at (41):

macy for agents and patients. Other pronouns like  $\text{ṣṣuṣ}$  *siyan* ‘where’ or  $\text{ṣṣṣṣ}$  *sikan* ‘how many’ are invariant, as described in section 4.2.3. Which morphological surface form is picked for Q if case is not specified basically depends on the GF it is linked to.

- (45) ... N      (↑ PRED)      = ‘*pro*’  
                                  ((↑ ANIM)      =  $\pm$ )  
                                  ((↑ CASE)      = {A, P, DAT, GEN, LOC, INS, CAUS})  
                                  (↑ PRONTYPE)      = *wh*

Since question pronouns stay *in situ*, it is not necessary to devise an outside-in functional uncertainty rule; the interrogative pronoun is already in the place the argument it stands in for would normally occupy. The interrogative pronoun as such wholly replaces an NP, so it is not possible to join modifiers to D’, like with personal pronouns:

- (46) a. \**Ang pengalye      sinyās      denisa?*  
           ang pengal=ye.Ø      sinyā-as      denisa  
           AT    meet=3SG.F.TOP    who-P    famous  
           ‘Whom famous did she meet?’  
       b. \**Ang sarava      siyan      veno?*  
           ang sara=va.Ø      siyan      veno  
           A    go=2.TOP    where    beautiful  
           ‘Where beautiful did you go?’

$\text{ṣṣuṣ}$  *sinya*’s other function as an adjective may come into play here together with a generic noun, however. In these cases,  $\text{ṣṣuṣ}$  *sinya* occupies the final position in the NP, that is, the first adjunct to N’:

- (47) a. *Ang pengalye      nyānas      denisa      sinyā?*  
           ang pengal=ye.Ø      nyān-as      denisa      sinyā  
           AT    meet=3SG.F.TOP    person-P    famous    which  
           ‘Which famous person did she meet?’

- b. *Ang sarava yanoya veno sinya?*  
 ang sara=va.Ø yano-ya veno sinya  
 AT go=2.TOP place-LOC beautiful which  
 ‘Which beautiful place did you go to?’

The interrogative pronoun asking for quantity, *sikan* ‘how much, how many’, likewise acts like a nominal modifier, and only ever does—that is, unlike *sinya* it does not have a double role. It may combine with any countable or quantifiable noun:

- (48) *Sabayan keynamang sikan?*  
 saha-yan keynam-ang sikan  
 come-3PL.M people-A how.many  
 ‘How many people came?’

#### Indefinite pronouns

Indefinite pronouns (Table 4.11) cover a range of both syntactic phrases and semantic roles: they may substitute NPs, but also PPs; and they may also form various core ar-

guments (SUBJ, OBJ, OBJ<sub>recip</sub>) as well as various oblique arguments (POSS, OBL<sub>loc</sub>, OBL<sub>ins</sub>, OBL<sub>caus</sub>). Those indefinite pronouns substituting PERSON and THING decline while those encoding PLACE, TIME, MANNER, and REASON are invariant. Thus, ᑭᑦᑭᑦ *enya* ‘everyone/ -thing’, ᑭᑦᑭᑦᑭᑦ *arilinya* ‘somebody/-thing’, and ᑭᑦᑭᑦ *ranya* ‘nobody/-thing’ can be declined for all cases, while the groups around ᑭᑦᑭᑦ *yanen* ‘everywhere’ and ᑭᑦᑭᑦ *tadayen* ‘everytime’ always imply location (= LOC), the group around ᑭᑦᑭᑦ *arēn* ‘in every way’ implies a manner (= INS), and ᑭᑦᑭᑦ *yāril* ‘for some reason’ implies a reason (= CAUS).

Regarding the functional definition of indefinite pronouns, at least Dalrymple (2001) treats them as lexical items proper, that is, she does not transcribe them as [PRED ‘*pro*’] with additional functional annotations from which the surface form arises, but simply like [PRED ‘*somebody*’]. Since indefinite pronouns are not composed in a systematic way, I will treat them as lexical items proper here as well. For a discussion of a few regularities that nonetheless exist, see section 4.2.4 (p. 157). Example (49) attempts to model the c- and f-structure of a sentence containing an indefinite pronoun indicating place, ᑭᑦᑭᑦ *yanen* ‘everywhere’.

- (49) *Balangya yanen ang Amān.*  
 balang-ya yanen ang Amān  
 search-3SG.M everywhere A Amān  
 ‘Amān searched everywhere.’

The annotation in example (49) assumes that by its lexical meaning alone, ᑭᑦᑭᑦ *yanen* ‘everywhere’ is identified as the locative adverbial stated in the verb’s a-structure (a possible OBJ has been dropped from the example). ᑭᑦᑭᑦ *ang Amān* itself does not mark 3SG.M, but the SUBJ relation gets this information through uni-

son with the respective marking on the verb with which the subject NP proper coheres. The relevant information is implicitly contained in the NP's INDEX feature (Bresnan et al. 2016: 186–192), which is not shown in the example above. Example (50) gives a generalized list of features which indefinite pronouns may encode.

- (50) ... N (↑ PRED) = ‘...’  
 ((↑ ANIM) = ±)  
 ((↑ CASE) = {A, P, DAT, GEN, LOC, INS, CAUS})

As noted above, only those indefinite pronouns referring to persons or things decline for case, and thus also for animacy for agents and patients; for other indefinite pronouns, functional information is provided by the lexicon, as described for  $\text{ᵛᵛ} \text{yanen}$  in (49). Regarding their distribution, indefinite pronouns behave like personal pronouns in that it is not possible for them to be modified by nominal or adjectival adjuncts, at least formally:

- (51) a. \**Ang vacye enyaley leno*  
 ang vac=ye.Ø enya-ley leno  
 AT like=3SG.F.TOP everything-P.INAN blue  
 ‘She likes everything blue.’  
 b. \**Ang sarayan yāril agon.*  
 ang sara=yan.Ø yāril agon  
 AT go=3PL.M.TOP somewhere foreign  
 ‘They are going somewhere foreign.’

Instead, it is necessary to modify the indefinite pronoun with a relative clause as illustrated by (52). Alternatively, it is possible to use a generic noun instead of the indefinite pronoun, like  $\text{ᵛᵛ} \text{linya}$  ‘thing’ instead of  $\text{ᵛᵛ} \text{nya}$  ‘everyone’ and  $\text{ᵛᵛ} \text{yano}$  ‘place’ instead of  $\text{ᵛᵛ} \text{yāril}$  ‘somewhere’ in (53).

- (52) a. *Ang vacye enyaley si leno*  
 ang vac=ye.Ø enya-ley si leno  
 AT like=3SG.F.TOP everything-P.INAN REL blue  
 ‘She likes everything that is blue.’  
 b. *Ang sarayan yāril si agon.*  
 ang sara=yan.Ø yāril si agon  
 AT go=3PL.M.TOP somewhere REL foreign  
 ‘They are going somewhere that is foreign.’

It may happen occasionally that a pronominal reference is to third persons of mixed genders. English has no problem here since it does not distinguish gender in plural, so both 'John' and 'Mary' in (56a) can simply be referred to by the pronoun *them*, which is indifferent to gender (number resolution occurs). Since Ayeri's personal pronouns distinguish gender in the plural as well as in the singular, however, there needs to be a way to deal with groups whose person features cannot easily be unified,

If the group referred to has already served as the controller of verb agreement, it is to be expected that the person features of whatever the verb agreement indicates is simply carried through the conversation, if the resolution is justifiable. Otherwise, a speaker will have to decide on which object or oblique pronoun to use. In either case, an animacy hierarchy operates in that animate referents outweigh inanimate ones. Mixed animate groups often default to masculine, though not in all cases. The rules which operate are the following:

1. If the conjuncts are of the same grammatical gender, use that. No gender resolution is necessary, since the person features of the conjuncts coincide.

$$\begin{array}{lcl} M & \cup & M \implies M \\ F & \cup & F \implies F \\ N & \cup & N \implies N \\ \text{INAN} & \cup & \text{INAN} \implies \text{INAN} \end{array}$$

2. If a conjunct referring to an animate referent is present, use the masculine form as the default for sexed entities; use neuter otherwise. Resolution to the animate conjunct's gender more generally is also possible.

$$\begin{array}{lcl} M \cup \text{INAN} & \implies & M \\ F \cup \text{INAN} & \implies & M \vee F \\ N \cup \text{INAN} & \implies & N \end{array}$$

3. For resolution of only animate referents, again, use the masculine form as the default. Resolution to the sexed conjunct's gender (M and F versus N) is possible here as well.

$$\begin{array}{lcl} M \cup F & \implies & M \\ M \cup N & \implies & M \\ F \cup N & \implies & M \vee F \end{array}$$

It is possible that the preference for the masculine form as a default is in part motivated by phonology, since /a/ is by far the most common vowel in Ayeri in all positions (section 1.2). Thus, it is also the least marked one, so that pronominal forms with /a/ are preferred over those with more marked vowels. Corbett (1983) makes an observation on Slovene, Polish, and, to a lesser extent, French that in these languages the first strategy in gender resolution is to resolve towards a semantically justified gender. If this fails, the second strategy is to resolve towards the form which least ambiguously marks plural. Both strategies are described as a general tendency in gender resolution (205). Since there is almost no syncretism in Ayeri's

third-person plural pronouns which would render certain forms ambiguous, the second strategy is moot.<sup>9</sup>

While coordinated NPs may be a very obvious case in which resolution occurs, there are even cases where simplex NPs trigger it. This is the case for lexical hybrids, for one. Hybrid nouns are nouns whose outward, morphological form encodes a gender different from the empirically observable gender of the denoted entity—there is a mismatch between form and meaning, grammatical and apparent gender.

Corbett (2006) quotes the Russian word *врач* *vrač* ‘(woman) doctor’, which is masculine at the level of syntax, but can be used to refer to female doctors alike at the level of semantics, hence triggering feminine agreement in more than half of examined relevant cases (158). Another example is German *Mädchen* ‘girl’, which is syntactically neuter, but semantically feminine.<sup>10</sup> Moreover, French *sentinelle* (quoted by Wechsler 2009 as an example) is a feminine noun, but often refers to a male person. English common nouns do not morphologically distinguish gender, but for instance, *child* may refer to both boys and girls, potentially triggering masculine *he* or feminine *she* rather than the syntactically required neutral *it* in anaphoric recourse.

Ayeri’s nouns are mainly distinguished by animacy; masculine and feminine only plays a role for those nouns which refer to beings, such as humans, animals, and gods (compare section 4.1). For GEND there is no cross-categorization as such, however, there is for the ANIM feature. Thus, for instance, *ḥēḥ* *subey* ‘slave’ is listed in the dictionary as inanimate even though it denotes a person. Conversely, *mimān* ‘opportunity’, *myaltan* ‘debt’, *natranga* ‘temple’, *napakaron* ‘acid’, and *piyu* ‘grain’ are all listed as animate in spite of not referring to beings, but to things, tangible or abstract. It may also be noted that it is a lot easier to find ‘miscategorized’ semantic inanimates than semantic animates. However, as noted before, Ayeri is rather generous about what it allows to be categorized as animate. Thus, not only beings count as animate, but also things closely associated with living things, such as events, concepts, or activities executed or connected to them; likewise things giving some semblance of life by growing or moving are often animate.

Of nouns referring to living beings of both sexes, there are *bayhi* ‘ruler’, *dapal* ‘boss, chief, superior’, *gan* ‘child’, *lajāy* ‘student’, *ledan* ‘friend’, and

<sup>9</sup> *teng* is used for both 3PL.F.A and 3PL.INAN.A; *tan* is used for both 3PL.F.GEN and 3PL.INAN.GEN. They all unambiguously indicate plural.

<sup>10</sup> The same goes for the German neuter *Weib* (compare Fleischer 2012: 165–166), which had been the long-time generic word for ‘woman’ (Old High German *wīb*, Middle High German *wîp*; cognate to English *wife*) before the feminine *Frau*, formerly denoting a woman of high social standing (OHG *frouwa*, MHG *vrouwe*), began to dominate in the first half of the 20th century. *Weib* is now derogatory.

ꨀꨣꨣ *sobaya* ‘teacher’, for instance. All of these should be treated as animate neuters, factually, however, agreement is usually semantic in these cases, if justified:

- (58) *Yam il-ilya badanang gan<sub>i</sub> ajamley yena<sub>i</sub>.*  
 yam il~il-ya badan-ang gan-Ø ajam-ley yena  
 DATT ITER~give-3SG.M father-A child-TOP toy-P.INAN 3SG.F.GEN

‘The child, the father gives her her toy back.’

The English translation of (58) is slightly odd in that ‘child’ is resumed by ‘her’, but in Ayeri ꨀꨣ *gan* ‘child’ is permissible as the referent of ꨀꨣ *yena* ‘her’. Since ꨀꨣꨣ *badan* ‘father’ denotes a male person, it would be odd for the feminine pronoun to be covariant with ꨀꨣꨣ *badan*—the only other permissible reading is that ꨀꨣ *yena* refers to a non-present feminine third person, the owner of the toy and the recipient not being the same person. However, as the indices show, this was not intended here; identity of the recipient and the owner was. There is no obligation for semantic agreement, so it is possible just as well to use ꨀꨣ *yona* ‘its’ here. It is also a choice of the speaker to use ꨀꨣ *gan* ‘child’ rather than ꨀꨣꨣ *lay* ‘girl’ more explicitly.

Besides hybrid nouns, there is also a class of nouns which Corbett (2006) refers to as ‘committee nouns’ after the observation that the word *committee* may trigger both singular and plural forms in agreement, with American English preferring singular agreement (*the committee has decided*), British English preferring plural agreement (*the committee have decided*), and Australian English allowing both with some preference for singular forms (212–213). Other typical committee nouns in English are *government*, *team*, and *family*. What they all have in common is that syntactically they are singular forms, but semantically they refer to a group of people. Examples of committee nouns in Ayeri are ꨀꨣꨣꨣꨣ *bayhang* ‘government’, ꨀꨣꨣꨣ *batay* ‘police’, ꨀꨣꨣꨣꨣ *kadang* ‘committee, coalition’, and ꨀꨣꨣꨣ *pandaba* ‘family’. For committee nouns in Ayeri, canonical agreement is singular, since the body denoted by the word as such is taken as the unit of reference. This is illustrated by (59). The canonical gender of the words is thus also animate neuter.

- (59) *Ang menuyo pandaba pandāpanas yona.*  
 ang menu-yo pandaha-Ø pandāpan-as yona  
 AT visit-3SG.N family-TOP relatives-P 3SG.N.GEN

‘The family is visiting its relatives.’

Here we have animate neuter singular agreement on the verb, as well as on the possessive pronoun: both agree syntactically with ꨀꨣꨣꨣ *pandaba* ‘family’ as expected. However, Corbett (2006) points out that cross-linguistically, there is a likelihood of semantic agreement creeping in, and that different constituents are differently affected by this, so that he arrives with the gradient described in (60)—the agreement hierarchy.

(60) Agreement hierarchy (Corbett 2006: 206 ff.):

attribute > predicate > relative pronoun > personal pronoun

Corbett (2006) notes on the above chart that for “any controller that permits alternative agreements, as we move rightwards along the Agreement Hierarchy, the likelihood of agreement with greater semantic justification will increase monotonically (that is, with no intervening decrease)” (207). That is, agreement of a target according to the syntactic features of its agreement controller are becoming increasingly likely as we go from right to left, whereas agreement according to a controller’s semantic features become increasingly likely as we go from left to right. Fleischer (2012) also finds that at least with regards to agreement triggered by the German lexical hybrid *Weib* ‘woman’ as surveyed under a diachronic perspective that the distance between a controller and its target also plays some role in semantic agreement being triggered. This effect is also to be expected in Ayeri, and, according to Corbett (2006)’s agreement hierarchy, especially so for personal pronouns, which we have discussed in this subsection. Thus, (59) might be followed up with:

- (61) *Tang mino tadayya si girendtang panca.*  
 tang mino taday-ya si girend=tang panca  
 3PL.M.A happy time-LOC REL arrive=3PL.M.A finally  
 ‘They are happy when they finally arrive.’

In (61), suddenly, anaphora relating to ጥብሩ *pandaba* ‘family’ before—the subject pronoun ጥንጥ *tang* ‘they’ as well as the pronominal suffix of the verb ጥንጥጥ *girendtang* ‘they arrive’—switch to animate masculine plural; semantic agreement has been triggered, and gender and number resolution thus occur. The pronoun of choice is masculine, since this is the default gender for mixed-gender groups of living beings, and plural, since ጥብሩ *pandaba* denotes a group of people.

However, no statistics for Ayeri have been compiled on this issue to date, and least of all across a variety of literary genres and across different simulated historical stages of the language. Another difficulty in this regard is that all existing texts in Ayeri are translations from English or German, and conceived as more or less carefully crafted written texts. Any statistics on the effect of distance on semantic agreement (if it can at all be found) will thus likely be skewed as compared to the output of native speakers, both written and spoken.

### 5.1.3 Nominal clitics

For nominal clitics, we have already seen how preposed case markers work; some nominal clitics are also described in section 3.2.5 in a way to establish why they are clitics rather than affixes or words. In the following subsections, we will have

a closer look at the morphosyntax of each group of clitics which can interact with nouns, with regards to nouns specifically for those clitics which can interact with more than this one part of speech.

#### Demonstrative prefixes

For one, there is the series of demonstrative prefixes—or rather, deictic proclitics: ມີ *eda-* ‘this’, ພີ *ada-* ‘that’, and ດີ *da-* ‘such’. In section 3.2.1 (p. 67), it was reasoned that in Ayeri, to capture all three clitics, a feature DEIX with values *this*, *that*, and *such* should be assumed in the place of PROX, since [PROX ±] does not apply to ດີ *da-*:

- (62) a. *eda-nangās*  
            $\text{eda}=\text{nanga-as}$   
            $\text{this}=\text{house-P}$   
           ‘this house’
- $$\left[ \begin{array}{c} \text{OBJ} \\ \left[ \begin{array}{cc} \text{PRED} & \text{'house'} \\ \text{ANIM} & + \\ \text{CASE} & \text{P} \\ \text{DEIX} & \text{this} \end{array} \right] \end{array} \right]$$
- b. *ada-veneyya*  
        $\text{ada}=\text{veney-ya}$   
        $\text{that}=\text{dog-LOC}$   
       ‘at that dog’
- $$\left[ \begin{array}{c} \text{OBL}_{\text{loc}} \\ \left[ \begin{array}{cc} \text{PRED} & \text{'dog'} \\ \text{CASE} & \text{LOC} \\ \text{DEIX} & \text{that} \end{array} \right] \end{array} \right]$$
- c. *da-mebirena*  
        $\text{da}=\text{mehir-ena}$   
        $\text{such}=\text{tree-GEN}$   
       ‘of such a tree’
- $$\left[ \begin{array}{c} \text{POSS} \\ \left[ \begin{array}{cc} \text{PRED} & \text{'tree'} \\ \text{CASE} & \text{GEN} \\ \text{DEIX} & \text{such} \end{array} \right] \end{array} \right]$$

The functional annotations of the deictic proclitics are thus, very straightforwardly, given in (63). Demonstrative clitics cannot be combined with pronouns of any kind, only with nouns; the combination of ດີ *da-* with a possessive pronoun does not result in the meaning of *\*such my*, *\*such your*, etc., but it derives independent possessive pronouns such as *mine*, *yours*, etc.

- (63) ...            Cl            (↑ DEIX) = {*this*, *that*, *such*}

#### Likeness prefix *ku-*

There is furthermore a clitic expressing likeness and resemblance, ກຸ *ku-* ‘like (a)’, which precedes common nouns, and which precedes proper nouns if no overt case marker is present and follows them if there is. In all three cases, this might be conveniently interpreted as the noun having an adverbial modifier meaning ‘like’.

- (64) a. *ku-ayonang*  
           *ku=ayon-ang*  
           *like=man-A*  
           ‘like a man’
- $$\left[ \begin{array}{c} \text{SUBJ} \left[ \begin{array}{c} \text{PRED} \text{ ‘man’} \\ \text{ANIM} + \\ \text{CASE} A \\ \text{ADJ} \left\{ \left[ \text{PRED} \text{ ‘like’} \right] \right\} \end{array} \right] \end{array} \right]$$
- b. *ku-Kaman.Ø*  
      *ku=Kaman.Ø*  
      *like=Kaman.TOP*  
      ‘like Kaman’
- $$\left[ \begin{array}{c} \text{TOP} \left[ \begin{array}{c} \text{PRED} \text{ ‘Kaman’} \\ \text{ADJ} \left\{ \left[ \text{PRED} \text{ ‘like’} \right] \right\} \end{array} \right] \end{array} \right]$$
- c. *ang Apitu-ku*  
      *ang=Apitu=ku*  
      *A= Apitu=like*  
      ‘like Apitu’
- $$\left[ \begin{array}{c} \text{SUBJ} \left[ \begin{array}{c} \text{PRED} \text{ ‘Apitu’} \\ \text{ANIM} + \\ \text{CASE} A \\ \text{ADJ} \left\{ \left[ \text{PRED} \text{ ‘like’} \right] \right\} \end{array} \right] \end{array} \right]$$

In cases like (64c), if there are adjectives following the noun, the clitic actually follows the whole NP like the ’s possessive clitic in English, at least from a logical point of view. Phonetically, however, the enclitic leans on the last word in the phrase. Regarding constituency, it is possible to replace all of *ang Apitu puti* with *ၵၵၵၵၵၵ danyāng* ‘such one’ and to still modify that by *ku-*, as illustrated by (65).

- (65) a. *ang Apitu puti-ku*  
           *ang=Apitu puti=ku*  
           *A= Apitu diligent=like*  
           ‘like diligent Apitu’
- b. *ku-danyāng puti*  
      *ku=danya-ang puti*  
      *like=such.one-A diligent*  
      ‘like the diligent one’
- c. *ku-danyāng*  
      *ku=danya-ang*  
      *like=such.one-A*  
      ‘like such one’

Regarding the examples in (65), we cannot simply state that the clitic should be adjoined to a bar level higher than the adjective in (66) even though the replacement tests point into this direction, since  $\text{ku-}$  cannot stand on its own as an independent word and LFG requires lexical integrity. Thus, we need to invoke the inside-out functional uncertainty principle again to associate the information provided by  $\text{-ku}$  with the right spot in our AVM: postposed  $\text{-ku}$  needs to feed not into the AP's ADJ list, but into that of the superordinate GF (or DF, for that matter). Example (67) furthermore demonstrates how the positioning variants of  $\text{ku-}$  and  $\text{-ku}$  differ in meaning and grammaticality.

- (67) a. *[ang Apitu puti ]-ku*  
           ang=Apitu puti =ku  
           A= Apitu diligent =like  
           'like diligent Apitu'
- b. *ang Apitu ku-puti*  
           ang=Apitu ku=puti  
           A= Apitu like=diligent  
           'diligent-like Apitu'
- c. \**ang Apitu [puti-ku]*  
           ang=Apitu puti=ku  
           A= Apitu diligent=like  
           Expected: 'like diligent Apitu'

In other words,  $\text{puti-ku}$  and  $\text{ku-puti}$  are also distinguished by the lack of postposed  $\text{-ku}$ 's possibility to modify the adjective, since adjectives only take  $\text{ku-}$  as a proclitic, but never as an enclitic. Thus, the functional difference is also reflected in a difference in the morphological distribution of the clitic. Regarding functional annotations—as already suggested by section 66—for the two kinds of  $\text{ku}$  we can posit:

- (68) a.  $\text{ku-}$  Cl ( $\uparrow$  ADJ PRED) = 'like'  
 b.  $\text{-ku}$  Cl (( $x \uparrow$ ) ADJ PRED) = 'like'  
 ( $x$  ADJ  $\uparrow$ )

Proclitic  $\text{ku-}$  in (68a) has a straightforward definition: the current phrase's ADJ is filled with an instance of [PRED 'like']. As described above, enclitic  $\text{-ku}$  in (68b), on the other hand, requires a slightly more complicated definition, since it does not feed into the ADJ list of the lexical head it is adjacent to, but into that of the phrase superordinate to the modifier it leans on phonetically. There thus is to be some phrase  $x$  which has an ADJ attribute which we can fill in with [PRED 'like'].

Regarding the ability of nominal clitics to combine with pronouns,  $\text{ku-}$  is probably most versatile in that it can combine with personal pronouns, as well as with demonstrative and indefinite pronouns, and the reciprocal pronoun  $\text{sitanya}$ —but not with all interrogative pronouns and the various forms of the relativizer  $\text{si}$ .

 Intended: ‘That is the man who he looks like.’

#### Inspecificity prefix *mə-*

While demonstrative elements make NPs more specific in selecting a particular specimen out of a group of entities, the proclitic 𑀓: *mə-* does the opposite: it expresses that the speaker refers to any representative of a group entities, not a specific one, as in (70). The functional definition for 𑀓: *mə-* should thus look as given in (71): the NP it is added to is neither definite nor specific reference, the speaker means just any representative of the kind the nominal head specifies.

- (71) 𑀓: *mə-* Cl (↑ DEF) = —  
 (↑ SPECIFIC) = —

Since according to Lyons (1999: 152), demonstratives are inherently definite—and their reference is specific, too—the deictic proclitics 𑀓: *eda-* ‘this’, 𑀓: *ada-*

‘that’, and 𐌆 *da-* ‘such’ are in complementary distribution with the inspecificity marker, as demonstrated by (72): neither combination of 𐌆 *mə-* and 𐌆 *eda-* in (72cd) results in an ungrammatical sentence because 𐌆 *eda-* encodes [DEF +, SPECIFIC +] while 𐌆 *mə-* encodes [DEF –, SPECIFIC –]. Attempting to assign opposing values to the same feature (DEF and SPECIFIC, respectively) must fail, since these cannot be united at the functional level.

- (72) a. *Ang nakasyon nibanye eda-mebirya.*  
 ang nakas-yon nihan-ye-Ø eda=mehir-ya  
 AT grow-3PL.N fruit-PL-TOP this=tree-LOC  
 ‘Fruits are growing on this tree.’
- b. *Ang nakasyon nibanye mə-mebirya.*  
 ang nakas-yon nihan-ye-Ø mə=mehir-ya  
 AT grow-3PL.N fruit-PL-TOP whichever=tree-LOC  
 ‘Fruits are growing on whichever tree.’
- c. \**Ang nakasyon nibanye mə-eda-mebirya.*  
 ang nakas-yon nihan-ye-Ø mə=eda=mehir-ya  
 AT grow-3PL.N fruit-PL-TOP whichever=this=tree-LOC
- d. \**Ang nakasyon nibanye eda-mə-mebirya.*  
 ang nakas-yon nihan-ye-Ø eda=mə=mehir-ya  
 AT grow-3PL.N fruit-PL-TOP this=whichever=tree-LOC

The inspecificity proclitic 𐌆 *mə-* cannot commonly be combined with pronouns, since personal pronouns as well as demonstrative pronouns have a definite reference; combining the clitic with an indefinite pronoun would be redundant. With interrogative pronouns it is feasible to use 𐌆 *mə-* as an intensifier, though without the vulgar tone of the English translation given in the following example:

- (73) *Amangreng mə-simin?*  
 amang=reng mə=simin  
 happen=3SG.INAN.A whichever=how  
 ‘How the fuck did that happen?’

#### Quantifying clitics

As described in section 3.2.5 (p. 94 ff.) and section 4.6.2, Ayeri has a number of suffixed—that is, enclitic—quantifiers which can attach to inflected nouns. These, along with their non-clitic counterparts, are modifiers and are thus part of an NP’s list of adjuncts, ADJ, along with adjectives and nominal adjuncts. An example of this is given in (74), using the clitic quantifier 𐌆 *-ikan* ‘much, many; very’. Since

the quantifier already lexically expresses a multitude in this case, the noun does not carry redundant plural marking.

- (74) a. *Sa tahayeng bisuay-ikan ban*  
 sa taha=yeng bisuay.Ø=ikan ban  
 PT have=3SG.F.A idea.TOP=many good

‘She has many good ideas.’

- b. 
$$\left[ \begin{array}{c} \text{TOP} \\ \text{OBJ} \end{array} \left[ \begin{array}{c} \text{PRED 'idea'} \\ \text{ANIM } + \\ \text{CASE P} \\ \text{ADJ } \left\{ \begin{array}{c} \left[ \text{PRED 'many'} \right] \\ \left[ \text{PRED 'good'} \right] \end{array} \right\} \end{array} \right] \right]$$

Clitic quantifiers as well can combine at least with independent personal pronouns especially in the plural, and demonstrative pronouns. A clitic quantifier can also still be recognized in the interrogative pronoun ꤁꤁꤁ *sikan* ‘how many’, although here it is incorporated into the pronoun itself, that is, there is no productive combination of interrogative pronouns and quantifiers, with the exception of ꤁꤁꤁ *sinya* ‘who’. With indefinite pronouns, quantifiers are somewhat redundant in some combinations, though it is feasible in this regard to use them for emphasis. The relativizer ꤁ *si* and its declined forms cannot be quantified; the simple and most common form of the relativizer, ꤁ *si*, is also unstressed, which makes it a bad host for a clitic. Combinations of pronouns and quantifying clitics are illustrated in (75).

- (75) a. *Ang koronay tas-ikan.*

## 5.2 Adjective and adverb phrases

Adjectives and adverbs in Ayeri are largely similar in that they can both be modified by adverbs like *very*, and they both modify heads: adjectives modify nouns, adverbs modify everything else. Carnie (2013: 51) urges his readers to think about whether it is sensible to distinguish between the two categories, so let us focus in this section on structural similarities and dissimilarities between the two, as well as their distribution as morphemes.

### 5.2.1 Adjective phrases

As described in the previous section, APs are usually found as adjuncts of NPs or DPs, where they describe properties of these nominal elements. Adjectives are likewise commonly found as open complements (XCOMP) in equative statements, which will be dealt with in section 5.4.8. Possessive pronouns can be used as adjective-like modifiers as well, though they are probably still better classified as DP heads, since they are functional morphemes. Possessive adjectives thus also do not share all the morphological properties of adjectives, for instance, they cannot be compared (see section 4.2.1, p. 147), also they can only be instanced once. In other words, it is not possible to modify the same noun with multiple possessive morphemes, which means that they are not part of ADJ. The phrase-structure rule in (76) and the c-structure tree in (77) show how an AP is constructed.

- (76) a.  $AP \rightarrow \begin{matrix} A' \\ \uparrow = \downarrow \end{matrix}$
- b.  $A' \rightarrow \begin{matrix} A^0 \\ \uparrow = \downarrow \end{matrix} \left( \begin{matrix} XP \\ (\uparrow \text{ GF}) = \downarrow \end{matrix} \right)$

Adjective phrases have an adjective as their lexical head. This head may be extended by modifiers adjoined to A'; A' repeats for the adjunction of multiple modifiers. Since modifiers follow their heads here as well, APs are also a right-branching constituent. Modifiers of adjectives are subsumed under the label XP here, which here stands for AdvP, NP, DP, and CP. An example of each phrase type modifying an adjective is given in (78).

- (78) a. adjective + AdvP adjunct:

*Adareng bisuayas sadayo kalam.*  
 ada-reng bisuay-as sadayo kalam  
 that-A.INAN idea-P crazy truly

'That is a truly crazy idea.'

- b. adjective + NP complement:

*Yang mino yanena nā.*  
 yang mino yan-ena nā  
 ISG.A happy son-GEN ISG.GEN

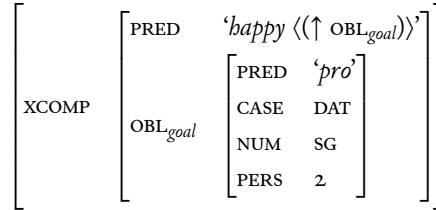

‘I am happy about my son.’

- c. adjective + DP complement:

*Yang mino yayam.*  
 yang mino yayam  
 ISG.A happy 3SG.M.DAT

‘I am happy for him.’

- d. adjective + CP complement:

*Yang valuy yomavāng edaya.*  
 yang valuy yoma=vāng edaya  
 ISG.A glad exist=2.A here

‘I am glad you are here.’

Example (78a) gives the *f*- and *c*-structures for the adjective phrase to show that ADJ may be recursive: an adjective which serves as one of many modifiers to a noun can itself be modified by adverbs. Likewise, an adjective–adverb combination can be complemented by an NP, as shown in (78c). Especially in (78b) and (78c) we can see Ayeri’s propensity for using cases with complements where English would use prepositions. Thus, in (78b), ‘about’ is expressed by putting the nominal complement in the genitive case: the NP complement expresses the source by which the experiencing subject becomes happy. This, however, should not be conflated with a possessor, POSS, but should be labeled separately as an oblique complement, *OBL<sub>src</sub>*. Similarly, the recipient of the subject’s happiness appears as an NP complement in the (ethical) dative in (78c). Instrumental and causative NP complements instead of PPs may be found as well.

Since in LFG, empty *X'* nodes are collapsed, LFG’s version of X-bar theory does not strictly distinguish between complements and adjuncts (Bresnan et al. 2016: 127, footnote 52); the functional annotation provides information about whether a sister node to *X<sup>0</sup>* is a complement or an adjunct instead. How do we know that the extensions to the adjective in (78) are complements rather than adjuncts? X-bar theory posits that complements and adjuncts are on different *X'* branches—a complement is a sister to the head whereas an adjunct is, so to speak, its cousin:

How does this hypothesis fare when applying constituency tests, though? With regards to complements and adjuncts to NP, Carnie (2013) explains, “Since complements are sisters to *X* and not *X'*, they cannot stand next to the word *one*. Adjuncts, by definition, can” (182). To target *A'* nodes, we need something corresponding to English *so*, which we find in Ayeri: *da-* ‘thus, so, such’. Since adverbs are adjuncts, it is possible to replace the adjective *sadayo* ‘crazy’ in (80a) with *da-* in (80b); the *A'* in (80a) being targeted is the sister to AdvP.

Continuing this replacement test for the other example sentences from (78), we can see that the outcomes are ungrammatical; the NPs are dependent on their lexical head, which cannot be omitted or replaced by a pro-form. The idiomatic English translations in (81) somewhat conceal this.<sup>11</sup> The literal translations try to

<sup>11</sup> At least to me, as a non-native speaker of English, these translations do not sound too odd if

- (80) a. *bisuayas sadayo kalam*  
 bisuay-as sadayo kalam  
 idea-P crazy truly  
 ‘a truly crazy idea’

- b. *Da-kalam bisuayang.*  
 da=kalam bisuay-ang  
 so=truly idea-A  
 ‘The idea is truly so.’

show that the complements are more tightly integrated into the sentence in Ayeri than in the idiomatic translations in an attempt to convey how they must seem non-sensical to an Ayeri speaker.

- (81) a. \**Yang da-yanena nā.*  
 yang da=yan-ena nā  
 ISG.A SO=SON-GEN ISG.GEN  
 ‘I am so about my son.’  
*Literally:* ‘I am my son’s so.’
- b. \**Yang da-yayam.*  
 yang da=yayam  
 ISG.A SO=3SG.M.DAT  
 ‘I am so for him.’  
*Literally:* ‘I am him so.’
- c. \**Yang da-yomavāng edaya.*  
 Yang da=yoma=vāng edaya  
 ISG.A SO=exist=2.A here  
 ‘I am so that you are here.’

context is taken into consideration. Carnie (2013: 181) gives an example \**the one of poems with a red cover*, referring to a book. His point is that *of poems* is a complement of *the book*, so *the book* cannot be replaced by a pro-form like *one*. However, he notes that at least some native English speakers find this example acceptable. Personally, I do not take offense either, but I am not a native speaker.

Further complications arise with regards to complementation in that non-clitic quantifiers like *an̄kyu* ‘really’ usurp the complement position so that an adjective’s complement XP appears as an adjunct. This is possibly due to syntactic weight (Wechsler 2009). Example (82) attempts to illustrate the c-structure for a displaced CP; the arrow shows the apparent movement from complement to adjunct.

(82) *Yang valuy an̄kyu, [yomavāng edaya].*

yang valuy an̄kyu yoma=vāng  
1SG.A glad really exist=2.A

‘I am really glad you are here.’

In LFG, however, there are no transformations by design; instead, c-structure is taken to be base-generated while acknowledging that different languages may have different phrase-structure plans, and the functional structure is what creates a sense of cohesion. Thus, even though the CP in (82) appears dislocated, the information is still found in the ‘right’ place in f-structure independent of the diverging c-structure, compare the AVM in (83), where the adjective is given as having an oblique nominal complement, and what surfaces as the CP adjunct is annotated accordingly as COMP, not as ADJ, even though in c-structure it appears in the position of an adjunct.

As pointed out in section 4.3, Ayeri’s adjectives inflect very little, since there is no agreement morphology. However, it is possible for adjectives to be compared and to be negated by means of morphology. This is reflected in the functional

$$(83) \left[ \begin{array}{c} \text{XCOMP} \\ \left[ \begin{array}{c} \text{PRED} \quad \text{'glad' } \langle (\uparrow \text{COMP}) \rangle \\ \text{ADJ} \quad \left[ \begin{array}{c} \text{PRED} \quad \text{'really'} \\ \text{COMP} \quad \left[ \begin{array}{c} \text{PRED} \quad \text{'exist' } \langle (\uparrow \text{SUBJ}), (\uparrow \text{OBL}_{loc}) \rangle \\ \text{SUBJ} \quad \left[ \begin{array}{c} \text{PRED} \quad \text{'pro'} \\ \text{CASE} \quad \text{A} \\ \text{PERS} \quad 2 \end{array} \right] \\ \text{OBL}_{loc} \quad \left[ \begin{array}{c} \text{PRED} \quad \text{'here'} \end{array} \right] \end{array} \right] \end{array} \right] \end{array} \right] \end{array} \right]$$

annotations given in (84). The features *COMPAR* and *NEG* appear in brackets here, since they do not apply to every adjective: adjectives normally appear in the positive in both regards, comparison and polarity, and are morphologically unmarked in these cases.

$$(84) \quad \dots \quad \text{A} \quad \begin{array}{ll} (\uparrow \text{PRED}) & = \text{'...'} \\ ((\uparrow \text{COMPAR})) & = \{\text{COMP}, \text{SUPL}\} \\ ((\uparrow \text{NEG})) & = + \end{array}$$

Examples of the different ways an adjective may be morphologically marked and their respective representation as an AVM are given in (85).

$$(85) \quad \begin{array}{ll} \text{a.} & \begin{array}{l} \text{nake-vā} \\ \text{nake=vā} \\ \text{tall=sUPL} \\ \text{'tallest'} \end{array} & \left[ \begin{array}{c} \text{PRED} \quad \text{'tall'} \\ \text{COMPAR} \quad \text{SUPL} \end{array} \right] \\ \\ \text{b.} & \begin{array}{l} \text{mingoy} \\ \text{ming-oy} \\ \text{capable-NEG} \\ \text{'incapable'} \end{array} & \left[ \begin{array}{c} \text{PRED} \quad \text{'capable'} \\ \text{NEG} \quad + \end{array} \right] \\ \\ \text{c.} & \begin{array}{l} \text{pasīsoy-eng} \\ \text{pasīsa-oy=eng} \\ \text{interesting-NEG=COMP} \\ \text{'more uninteresting'} \end{array} & \left[ \begin{array}{c} \text{PRED} \quad \text{'interesting'} \\ \text{COMPAR} \quad \text{COMP} \\ \text{NEG} \quad + \end{array} \right] \end{array}$$

As described before (section 4.3.1), the morphemes used for synthetic comparison of adjectives are grammaticalized clitics literally meaning ‘rather, more’ (ཤར་ *-eng*) and ‘most’ (ཤར་ *-vā*) as lexical quantifiers. With adjectives, there is no clear-cut line between their functional and their lexical use. I have analyzed them here

as functional, since they may be interpreted as such, depending on context. As we have observed before (section 4.6.2), quantifier clitics may modify adjectives like any other adverbial modifiers, except that their surface form is clitic rather than free. Quantifying adverbs, both enclitic and free, thus also find themselves in ADJ.

- (86) a. *luyu-mas*  
           *luyu=mas*  
           strange=kind.of  
           ‘kind of strange’
- $$\left[ \begin{array}{l} \text{PRED} \quad \text{'strange'} \\ \text{ADJ} \quad \left\{ \left[ \text{PRED} \quad \text{'kind of'} \right] \right\} \end{array} \right]$$
- b. *valuy ipan.*  
      *valuy ipan*  
      glad extremely  
      ‘extremely glad’
- $$\left[ \begin{array}{l} \text{PRED} \quad \text{'glad'} \\ \text{ADJ} \quad \left\{ \left[ \text{PRED} \quad \text{'extremely'} \right] \right\} \end{array} \right]$$

### 5.2.2 Adverb phrases

Adverbs, as (86b) shows, can easily be converted from adjectives. Thus, *ṣṣṣ ipan* ‘extreme’, which is normally an adjective, is used there in an adverbial way, meaning ‘extremely’. The word stays the same, however: *ṣṣṣ ipan*, without a derivative affix akin to English *-ly* or French *-ment*. Since adverbs and adjectives are largely similar in that they provide additional information about the nature or circumstance of a noun or another part of speech, Carnie (2013) poses the question whether adjectives and adverbs should be better analyzed as being part of the same category. He reasons that

Both Adj and Adv can be modified by the word *very*, and they both have the same basic function in the grammar—to attribute properties to the items they modify. In fact, the only major distinction between them is syntactic: Adjectives appear inside NPs, while adverbs appear elsewhere. (51)

Adjectives and adverbs are in complementary distribution, which, he writes, would normally be taken as evidence that these two things are of the same category. In fact, the only reason Carnie (2013) adduces for keeping the two categories apart is “because they are familiar to most people”, and he prompts the reader to consider that uniting them in a single supercategory “might provide a better analysis and might be better motivated scientifically” (51). Bresnan et al. (2016: 126) also classify both adjectives and adverbs as heads of AP with reference to Emonds (1988). As described in section 4.6, the only morphology attributive adverbs take in Ayer is comparison morphology and negation. This is the same as with adjectives indeed, hence the functional specifications appear equal:

- (87) ...            A            ( $\uparrow$  PRED)        =    ‘...’  
   (( $\uparrow$  COMPAR)    =    {COMP, SUPL})  
   (( $\uparrow$  NEG)        =    +)

If we look at the phrase structure (88) and the c-structure (89) for adverbs, however, there is a slight difference in that adverbs cannot serve as xCOMP in equative statements; they also can only be modified by other adverbs, but not by NP, DP, or CP.<sup>12</sup> On the other hand, adjectives are restricted to nominal contexts whereas adverbs may modify any other lexical category: verbs, adjectives, prepositions, as well as other adverbs.

- (88) a.    AdvP  $\rightarrow$  Adv'  
    $\uparrow = \downarrow$   
       b.    Adv'  $\rightarrow$  Adv<sup>0</sup>     $\left( \begin{array}{c} \text{AdvP} \\ \downarrow \in (\uparrow \text{ADJ}) \end{array} \right)$   
    $\uparrow = \downarrow$

Example (90) gives examples of modifiers of adverbs. These modifiers are often quantifying adverbs, whether clitic ones or free ones. Since adjectives and adverbs are not distinguished by morphology, the heads of both phrases, रक्षक *vakṣa* ‘careful’ and साधारण *bita* ‘ordinary, normal’, may be interpreted as well as adjectives, depending on context.

<sup>12</sup> For adjectives, compare (76), (77), and (84) in section 5.2.1.

- (90) a. *bita ikan-ikan*  
           bita       ikan.ikan  
           ordinarily completely  
           ‘completely ordinarily’

$$\left[ \text{ADJ} \left\{ \left[ \text{PRED 'ordinarily'} \right] \left[ \text{ADJ} \left\{ \left[ \text{PRED 'completely'} \right] \right\} \right] \right\} \right]$$

- b. *vakisoy -ma*  
      vakisa-oy =ma  
      carefully-NEG=enough  
      ‘not carefully enough’

$$\left[ \text{ADJ} \left\{ \left[ \text{PRED 'carefully'} \right] \left[ \text{NEG +} \right] \left[ \text{ADJ} \left\{ \left[ \text{PRED 'enough'} \right] \right\} \right] \right\} \right]$$

For the clitic  $\text{ku}$  ‘like’ described above (68b), it was necessary to make a separate rule for the prefixed and suffixed version. This, however, is not necessary for clitic quantifiers, since they attach immediately to the head they modify rather than to the last word of the AdvP. Besides their diverging morphological distribution, it may thus be assumed that the functional scheme given in (87) also holds for enclitic quantifiers. Quantifiers appear to be able to be modified in turn, as illustrated by (76) from section 3.2.5 (compare p. 98), which is repeated again here, abbreviated;  $\text{ikan}$  ‘much, many, very’ is modified in this case by  $\text{kagan}$  ‘far too’ to convey the meaning ‘far too many’.

- (91) *keynam -ikan kagan*  
      keynam-Ø =ikan kagan  
      people-TOP=many far.too  
      ‘far too many people’

Besides the parenthetical insertion tests on  $\text{kagan}$  in section 3.2.5, the following examples show that  $\text{kagan}$  also cannot swap places with other nominal modifiers without a change in meaning (92a), that  $\text{kagan}$  does not work when

the rest of the NP is replaced by an anaphora (92b), and that  $\text{ၵၵၵၵၵ} -ikan$  cannot be replaced by an anaphora either (92c). It should be clear that  $\text{ၵၵၵၵၵ} kagan$  is dependent on  $\text{ၵၵၵၵၵ} ikan$ , and that  $\text{ၵၵၵၵၵ} -ikan$  has head-like qualities with regards to modification by  $\text{ၵၵၵၵၵ} kagan$ .

- (92) a.  $\text{ၵၵၵၵၵ-ikan gino kagan}$   
            $\text{keynam=ikan gino kagan}$   
           people=many drunk far.too  
           ‘many far too drunk people’  
           Intended: ‘far too many drunk people’
- b.  $\text{*tas kagan}$   
        $\text{tas kagan}$   
       3PL.M.P far.too  
       ‘far too of them’
- c.  $\text{*keynam da-kagan}$   
        $\text{keynam da=kagan}$   
       people so=far.too  
       ‘far too so people’

As (92a) shows,  $\text{ၵၵၵၵၵ} kagan$  and  $\text{ၵၵၵၵၵ} ekeng$  also work with regular adjectives, and it is possible as well to add further adjuncts to the AdvP, for instance,  $\text{ၵၵၵၵၵ patu}$  ‘surprisingly’ in (93).  $\text{ၵၵၵၵၵ} kagan patu$  ‘surprisingly too’, thus, has to form a phrase which acts as a modifier to  $\text{ၵၵၵၵၵ} gino$  ‘drunk’. Likewise, it is not ungrammatical to say  $\text{ၵၵၵၵၵ-ikan kagan patu}$  ‘surprisingly too many people’. Since  $\text{ၵၵၵၵၵ} kagan$  apparently projects an AdvP (as it can be modified), it cannot be a clitic, because clitics do not project phrases by their very nature. Thus, the c-structure in (94c) is possibly actually more correct, in that it is constructed in analogy to the one for an adjective modified by  $\text{ၵၵၵၵၵ} kagan$  in (93b).

The c-structure in (94c) assumes that the head of the NP has an AdvP sister which has no head, but only an adjunct which is the AdvP headed by  $\text{ၵၵၵၵၵ} kagan$ . The head position left empty here is where one would find the adjective in (93b). It is also the position where one would expect a free quantifier, except that the quantifier in this example is clitic and found merged with the noun. In the functional representation, a clitic quantifier also logically places its information in the same spot a free quantifier would, by the distributed exponence principle: the ADJ of the maximal projection, that is, the TOP NP’s ADJ in (94). Since word order matters with regards to quantification, however, we know that  $\text{ၵၵၵၵၵ} kagan patu$  modifies its antecedent adjective or adverb, which is  $\text{ၵၵၵၵၵ} -ikan$  rather than  $\text{ၵၵၵၵၵ} gino$ . Furthermore, since empty terminals and non-branching bar levels are supposed to be pruned, the tree in (93b) should have the structure depicted in (95).

(93) a. 
$$\left[ \text{ADJ} \left\{ \begin{array}{l} \left[ \text{PRED} \text{ 'many'} \right], \\ \left[ \text{PRED} \text{ 'drunk'} \right] \\ \left[ \text{ADJ} \left\{ \begin{array}{l} \left[ \text{PRED} \text{ 'far too'} \right] \\ \left[ \text{ADJ} \left\{ \left[ \text{PRED} \text{ 'surprisingly'} \right] \right\} \right] \right\} \right] \end{array} \right\} \right\} \right]$$

- (94) a. *keynam-ikan kagan patu gino*  
 keynam-Ø=ikan kagan patu gino  
 people-TOP=many far.too surprsingly drunk  
 ‘surprisingly far too many drunk people’

Building the tree this way, it is assumed that there is a hidden AdvP, which is a little unintuitive. However, if the AdvP headed by  $\text{ႁႃႉႱ}$  *kagan* ‘far too’ were attached directly to N’, the constituency would be wrong:  $\text{ႁႃႉႱ}$  *kagan* would modify the noun,  $\text{ႁႃႉႱႱႱႱႱႱ}$  *keynam-ikan* ‘many people’ as a unit, compare (96).  $\text{ႁႃႉႱႱႱႱႱႱ}$  *-ikan* ‘many’ would also wrongly appear at the same level as  $\text{ႁႃႉႱ}$  *kagan* instead of subordinated to it, unless one were to give  $\text{ႁႃႉႱ}$  *kagan*’s maximal projection an annotation like  $\downarrow \in (\uparrow \text{ADJ ADJ})$ , again assuming that  $\text{ႁႃႉႱ}$  *kagan* is identified as modifying  $\text{ႁႃႉႱႱႱႱႱႱ}$  *-ikan* on the grounds of word order.

Based on the observation above that  $\text{ႁႃႉႱႱႱႱႱႱ}$  *-ikan* acts like a head, it might also be the case that both  $\text{ႁႃႉႱႱႱႱႱႱ}$  *-ikan* and its opposite  $\text{ႁႃႉႱႱႱႱႱႱ}$  *-kay* ‘few, little’ are acting as free morphemes in such contexts, thus eradicating the need for an empty slot in the c-structure in (94c). That is, these two forms would be simple clitics which appear in their full form in this context, the full form happening to be homonymous with the clitic form at this stage, as illustrated by (97).

On the other hand, when using other combinations, like *ᑭᑦᑎᑦᑎᑦᑎᑦᑎᑦ -ma nilay* ‘probably enough’, the dilemma starts anew, since *ᑭᑦᑎᑦᑎᑦᑎᑦᑎᑦ -ma* is even more likely a clitic than *ᑭᑦᑎᑦᑎᑦᑎᑦᑎᑦ -ikan* and *ᑭᑦᑎᑦᑎᑦᑎᑦᑎᑦ -kay*, which—untypically of clitics—carry stress, whereas *ᑭᑦᑎᑦᑎᑦᑎᑦᑎᑦ -ma* does not.

- (98) a. *keynam-ma nilay*  
           keynam-Ø=ma nilay  
           people-TOP=enough probably  
           ‘probably enough people’
- b. *Adareng-ma nilay.*  
       ada-reng=ma nilay  
       that-A.INAN=enough probably  
       ‘That is probably enough.’

Ayeri is different from English, but since English is often used as a model for generative grammar, let us also try to see what the ‘canonical’ case for modification of APs is for the sake of exploring possibilities. Sobin (2011: 110) likens intensifiers of adjectives like *very* (which I have subsumed under the label ‘quantifier’ and classified as adverbs) to prepositions. He analyzes both, intensifiers and prepositions, as specifiers:

This, however, does not seem to be how Ayeri works, if we assume that there are no transformations and that Ayeri is consistently right-branching. An approach like Sobin (2011) delineates for English, thus, generates the wrong word order for free intensifying adverbs like ʔə́ anyku ‘really’, whether one assumes that an adverb in Spec is the first element in the phrase or the last. In fact, it consistently follows its head, as we have seen before.

- (100) a. \*Yāng **anyku** mingoy sibunana  
           yāng anyku mingoy sibunana  
           3SG.M.A really incapable syntax-GEN
- b. \*Yāng mingoy sibunana **anyku**  
           yāng mingoy sibunana anyku  
           3SG.M.A incapable syntax-GEN really
- c. Yāng mingoy **anyku** sibunana  
           yāng mingoy anyku sibunana  
           3SG.M.A incapable really syntax-GEN
- ‘He is really incapable of syntax.’

It is also incompatible with our analysis of the most common quantifying and degree adverbs as clitics, since clitics, at least in LFG, cannot exist disembodied from their hosts due to lexical integrity:

- (101) <sup>!</sup>mino yanena-ikan  
           mino yan-ena=ikan  
           happy boy-GEN=very/many  
           ‘happy about the many boys’  
           Intended: ‘very happy about the boy’

Since Spec also cannot recursively branch (Carnie 2013: 184), examples like (91) would not be grammatical either if ʔə́ -ikan were in the position of a specifier.

As a clitic, ၵိၵ်ႉ *-ikan* cannot be a head either as a logical consequence of lexical integrity.

In conclusion, Ayeri probably does not follow the way of English with regards to quantifiers and intensifiers of adjectives in that assuming these elements are in Spec results in wrong predictions about word order. Since LFG does not assume movement, the hypothesis that Ayeri's quantifiers are in Spec can be discarded, since without movement it results in wrong predictions about word order. It is probably more likely that quantifiers are treated as adjuncts with a constraint that quantifiers cannot be iterated—if a quantifier is present, no other quantifier may modify the same head unless it is coordinated with the first, if this is semantically plausible at all. There also needs to be a constraint which says that quantifiers always need to be adjacent to their modification target. Quantifiers, however, are optional elements, that is, they are not required to complete their head's argument structure in the way a preposition or a verb require an NP complement. It is tempting to treat clitic quantifiers the same way as free ones, just with an empty head position; the quantifying adverb instead finds itself cliticized to the preceding head, compare (94c) and (95).

### 5.3 Adpositional phrases

As described in the section on the morphology of adpositions (section 4.4), Ayeri employs both prepositions and postpositions, though the former are a lot more common and basic than the latter. Thus, PPs are an exceptional domain in that

very limited left-branching is possible in that the complement of a postpositions precedes its head, the postposition. The complement is again right-branching, however. Since the label ‘AP’ has already been used for ‘adjective phrase’, I will use the common label ‘PP’ to refer to both prepositional and postpositional phrases, with their respective heads referred to as ‘P<sup>0</sup>’. As described earlier, there is no morphological difference between prepositions and postpositions; head placement is a syntactic issue and the preference of placement is rooted in the lexical entry for each adposition, albeit ParGram (2009–2016) does not list a feature to distinguish between preposition and postposition, probably because it does not have any relevance to semantics.

LFG categorizes the object of an adposition as OBL<sub>θ</sub>, where *θ* stands for the thematic role of the embedded phrase (Dalrymple 2001: 9–10). As we have seen in the previous chapter, adpositions in Ayeri usually allow adpositional objects to mark one of three cases:

**Locative:** Standard case for prepositional objects, indicates a location (LOCATION). It usually corresponds to English ‘at’, ‘in’.

**Dative:** Indicates motion towards the direction the adposition indicates (GOAL, DIRECTION) in cases where just locative marking would be ambiguous, for instance, ‘up to’ instead of ‘onto’, since *ᄒᄒᄒᄒᄒ manga ling* can mean both, by itself. It usually corresponds to English ‘to’, ‘for’.

**Genitive:** Indicates motion from the direction the adposition indicates (SOURCE, ORIGIN) in cases where just locative marking would be ambiguous, for instance, ‘down from’ instead of ‘to the bottom’, since *ᄒᄒᄒᄒᄒ manga avan* can mean both, by itself. It usually corresponds to English ‘of’, ‘from’.

Ayeri does not make use of verbs which take a transitive PP as a complement, so there are no cases where an adpositional object is a required part of a verb’s argument structure as in English *talk to someone*; the semantic role of the PP complement is encoded by the PCASE attribute. The complement is also presented as not governing a prepositional object, but the preposition is purely functional (151–153). The case for English is illustrated by (103).

Ayeri, in contrast to English, often uses an NP complement marked with one of the cases in the list above, compare (104). In the case of *ᄒᄒ nara-* ‘speak, talk’, the complement thus appears in the locative case, but as an NP, not as a PP. Thus, there is no PCASE attribute necessary here, since there is no preposition to indicate the relation of the complement to the verb because case marking accomplishes this function. Which oblique case the complement appears in is determined by the a-structure of the verb, not by the semantics of the complement. Since the dative is also used for the BENEFICIARY role, the argument expressing the direction of the

IP

(↑ SUBJ) = ↓      ↑ = ↓

PRED    *'talk' <(↑ SUBJ), (↑ OBL<sub>goal</sub>) >'*

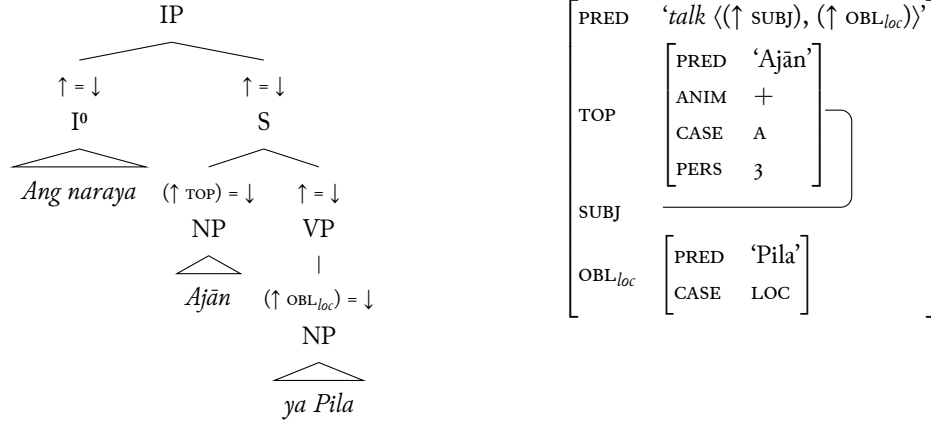

SUBJ    [ PRED    *'John'*  
          PERS    3 ]

OBL<sub>goal</sub> [ PRED    *'Mary'*  
          PCASE    OBL<sub>goal</sub> ]

In Ayeri, PPs proper may either be locative complements of the verb or locative adverbials ungoverned by the verb, though the number of verbs taking PP complements is smaller than in English due to case marking, as described above. As mentioned initially, Ayeri possesses prepositions as well as postpositions. With regards to word order typology, we can thus note:

The fact that Ayeri has both prepositions and postpositions is also reflected in the phrase structure rules given in (106). Here, the P<sup>0</sup>s in brackets are supposed to mean that such an element can appear in either position. Since there are no circumpositions in Ayeri, only ever one site is occupied. XP is used again as a catch-all term for various phrase types which form complements of semantic adpositions in the form of NPs and DPs, but especially the postposition *hes* *pesan* ‘until’ may

- (104) *Ang naraya Ajān ya Pila.*  
 ang nara-ya Ø Ajān ya Pila  
 AT talk-3SG.M TOP Ajān LOC Pila  
 ‘Ajān talks to Pila.’

also have a CP complement, that is, a whole complement clause. The nominal complements are objects governed by the adposition.

- (106) a.  $PP \rightarrow P'$   
           ↑ = ↓
- b.  $P' \rightarrow \begin{pmatrix} P' \\ \uparrow = \downarrow \end{pmatrix} \left( \begin{array}{c} AdvP \\ \downarrow \in (\uparrow ADJ) \end{array} \right)$
- c.  $P' \rightarrow \begin{pmatrix} P^0 \\ \uparrow = \downarrow \end{pmatrix} \{ (\uparrow OBJ) = \downarrow \mid (\uparrow COMP) = \downarrow \} \begin{pmatrix} XP \\ \uparrow = \downarrow \end{pmatrix}$

The same as above is spelled out again in c-tree form in (107). Prepositional phrases, if not subcategorized by the verb, are optional information and thus not governed by the verb; the respective PP is thus part of the set of adjuncts. Some verbs, like ᐃᑦᑦᑦ: *tapy-* ‘put’, may take PP complements headed by an adposition, for instance, in cases like *Mary puts the book* [<sub>PP</sub> [<sub>P</sub> *on*] [<sub>NP</sub> *the pile*]]. The PP *on the pile* is not an adjunct here because *She does so on the pile* makes no sense; the PP must be an argument of the verb in this case, not additional, optional information. Ayeri behaves the same way in this regard. These governed PPs are categorized as OBL<sub>θ</sub> with *θ* replaced by the proper semantic macrorole (*loc*, *src* or *goal*).

With regards to functional structure, the difference between preposition and postposition does not matter, so the AVM in (108) does not make a formal distinction between prepositions and postpositions. As described in section 3.2.5 (p. 77)

(107) a. Prepositions:

b. Postpositions:

and section 4.4, there is a particle  $\text{མངའ་}$  *manga*, which has been analyzed as a clitic. This particle indicates that an adposition has a directional reading (specifically, into the direction of the preposition). This is encoded by the feature PSEM, which is represented morphologically by said particle and hence not generally present.

(108) a. ...	P	(↑ PRED)	=	'... <(↑ OBJ)>'
		(↑ PCASE)	=	{OBL <sub>loc</sub> , OBL <sub>goal</sub> , OBL <sub>src</sub> }
		(↑ OBJ CASE)	= <sub>c</sub>	LOC <sup>13</sup>
b. $\text{མངའ་}$ <i>manga</i>	Cl	(↑ PSEM)	=	<i>dir</i>
		(↑ PCASE)	=	OBL <sub>goal</sub>

German, for one, encodes the difference between locational and directional of a group of prepositions uses as well, but by an alternation in the prepositional object's case between DAT (locational) and ACC (directional). Thus, *auf dem Tisch* (on DEF.DAT.M.SG table) means 'on the table', whereas *auf den Tisch* (on DEF.ACC.M.SG table) means 'onto the table'. Butt (2005) defines this alternation (albeit for *in* 'in' and *an* 'at') as:

(109)	PSEM <i>dir</i> $\implies$	(↑ OBJ CASE) = <sub>c</sub> ACC	[German]
	PSEM <i>loc</i> $\implies$	(↑ OBJ CASE) = <sub>c</sub> DAT	

The PSEM attribute thus governs the case of the prepositional object by a requirement that its case be either ACC or DAT, depending on its value. Since nouns in German always carry case, the PSEM attribute needs to be present in the lexical

<sup>13</sup> This lexical rule goes for all adpositions except  $\text{ལྷོང་}$  *ling* and  $\text{མངའ་}$  *avan*, which require special treatment with regards to case marking; see below.

rules for all prepositions which show the ACC/DAT alternation (*an, auf, hinter, in, neben, über, unter, vor, zwischen*). In Ayeri, however, the particle  $\text{ᄡᆞᆯ}$  *manga* alternates with nothing, so the absence of marking *dir* indicates a locational reading. Since the PSEM attribute finds no overt realization in the absence of the morphological marker, however, it may as well be omitted. Different than in German, the presence or absence of directionality marking also does not influence the case of the adpositional object.

Example (110) illustrates the alternation in annotation between a bare adposition and one modified by  $\text{ᄡᆞᆯ}$  *manga*:  $\text{ᄡᆞᆯ}$  *manga* adds the feature–value pair [PSEM *dir*] to the ADJ (or OBL<sub>θ</sub> if the PP is governed by a verb) of the partial f-structure in (110b), which is how the difference between locational ‘in’ and directional ‘into’ is represented. The case of the OBJ is LOC in both cases.

- (110) a. *kong nangaya*  
           *kong nanga-ya*  
           *inside house-LOC*  
           ‘in the house’
- $$\left[ \text{ADJ} \left\{ \begin{array}{l} \left[ \text{PRED} \text{ ‘inside } \langle (\uparrow \text{OBJ}) \rangle \text{’} \right] \\ \left[ \text{OBJ} \left[ \begin{array}{l} \text{PRED} \text{ ‘house’} \\ \text{CASE} \text{ LOC} \end{array} \right] \right] \end{array} \right\} \right]$$
- b. *manga kong nangaya*  
      *manga kong nanga-ya*  
      *DIR inside house-LOC*  
      ‘into the house’
- $$\left[ \text{ADJ} \left\{ \begin{array}{l} \left[ \text{PRED} \text{ ‘inside } \langle (\uparrow \text{OBJ}) \rangle \text{’} \right] \\ \left[ \text{PCASE} \text{ OBL}_{\text{goal}} \right] \\ \left[ \text{PSEM} \text{ dir} \right] \\ \left[ \text{OBJ} \left[ \begin{array}{l} \text{PRED} \text{ ‘house’} \\ \text{CASE} \text{ LOC} \end{array} \right] \right] \end{array} \right\} \right]$$

With the prepositions  $\text{ᄡᆞᆯ}$  *ling* ‘on top of’ and  $\text{ᄡᆞᆯ}$  *avan* ‘at the bottom of’ there is another alternation, based on case, for verbs which do not encode direction. This is rooted in the etymology of these words:  $\text{ᄡᆞᆯ}$  *ling* as a noun means ‘top’,  $\text{ᄡᆞᆯ}$  *avan* means ‘ground, bottom’. The directional variants of these prepositions mean ‘to the top, onto’ and ‘to the bottom’. These are telic in that they express arriving at the destination specified by the adpositional object. However, Ayeri does not possess separate adpositions to express ‘up’ and ‘down’ as atelic concepts, that is, without referring to arriving at a destination.<sup>14</sup> Instead,  $\text{ᄡᆞᆯ}$  *ling* and  $\text{ᄡᆞᆯ}$  *avan* double for ‘up’ and ‘down’ with dative complements, respectively, to mark the difference, compare Table 5.1. Note, however, that Ayeri does not possess intransitive adpositions, with the exception of a few verbs where the adposition is a lexicalized part of the expression, for instance,  $\text{ᄡᆞᆯ}$   $\text{ᄡᆞᆯ}$  *tapy-dayrin* ‘save (assets)’, with the fossilized, now

<sup>14</sup> I concede that the chosen terminology is slightly problematic since, strictly speaking, ‘up’ and ‘down’ are also directions rather than locations. Moreover, whether ‘up to’ and ‘down from’ qualify as atelic is probably debatable, since they as well suggest arriving at a destination eventually.

Table 5.1: Case alternations of လှံ *ling* and အရံ *avan*

	+ LOC	+ DAT
<i>ling</i> ‘top’	on top of	up
<i>manga ling</i> ‘to top’	to the top of	up to
<i>avan</i> ‘bottom’	at the bottom of	down
<i>manga avan</i> ‘to bottom’	to the bottom of	down to

defunct preposition လှံ *dayrin* ‘beside, next to’ (modern လှံ *kayvo*). ‘Up’ and ‘down’ thus refer to their transitive uses as in *up the stairs* and *down the hill*, respectively. (III) provides example sentences for all configurations.

- (III) a. *Ang lampyo paray ling nayingya.*

AT go-LOC pilgrim-TOP DIR top.of castle-DAT  
‘The pilgrim goes up to the castle.’
- For each example, the following table shows the semantic and syntactic structure of the prepositional phrase:
- a. 
$$\left[ \begin{array}{ll} \text{PRED} & \text{'top of } \langle (\uparrow \text{OBJ}) \rangle \\ \text{PCASE} & \text{OBL}_{loc} \\ \text{PSEM} & loc \\ \text{TEL} & + \\ \text{OBJ} & \left[ \begin{array}{ll} \text{PRED} & \text{'roof'} \\ \text{CASE} & \text{LOC} \end{array} \right] \end{array} \right]$$
- b. 
$$\left[ \begin{array}{ll} \text{PRED} & \text{'top of } \langle (\uparrow \text{OBJ}) \rangle \\ \text{PCASE} & \text{OBL}_{goal} \\ \text{PSEM} & dir \\ \text{TEL} & + \\ \text{OBJ} & \left[ \begin{array}{ll} \text{PRED} & \text{'tree'} \\ \text{CASE} & \text{LOC} \end{array} \right] \end{array} \right]$$
- c. 
$$\left[ \begin{array}{ll} \text{PRED} & \text{'top of } \langle (\uparrow \text{OBJ}) \rangle \\ \text{PCASE} & \text{OBL}_{loc} \\ \text{PSEM} & loc \\ \text{TEL} & - \\ \text{OBJ} & \left[ \begin{array}{ll} \text{PRED} & \text{'hill'} \\ \text{CASE} & \text{DAT} \end{array} \right] \end{array} \right]$$
- d. 
$$\left[ \begin{array}{ll} \text{PRED} & \text{'top of } \langle (\uparrow \text{OBJ}) \rangle \\ \text{PCASE} & \text{OBL}_{goal} \\ \text{PSEM} & dir \\ \text{TEL} & - \\ \text{OBJ} & \left[ \begin{array}{ll} \text{PRED} & \text{'castle'} \\ \text{CASE} & \text{DAT} \end{array} \right] \end{array} \right]$$

Like adjectives, adpositions may be modified by adverbs, for instance, for intensification. This means that items from the class of adverbs categorized as quantifiers (section 4.6.2) are likely to occur. As we have seen previously, the most common such expressions are enclitic, that is, they merge with  $P^0$  rather than be adjuncts to  $P'$ . An analysis of the c- and f-structure of adpositional phrases with adverbial modifiers is shown in (114).

- (114) a. *Ang nimpya Tapan manga kong nangaya sirimang.*  
 ang nimp-ya Ø Tapan manga kong nangaya sirimang  
 AT run-3SG.M TOP Tapan DIR inside house-LOC straight

‘Tapan is running straight into the house.’

- b. *Ang galamyan panganya pesan-ben.*  
 ang galam=yan.Ø pangan-ya pesan=hen  
 AT wait=3PL.M.TOP end-LOC until=all

‘They waited until the very end.’

the triad LOC–DAT–GEN to indicate *loc*, *goal*, and *src* also with adpositions in general, either with *manga* grammaticalizing further to then solely mark direction, necessitating an obligatory DAT/GEN complement to indicate which way around, or with *manga* withering to zero, since the cases are already enough to mark direction. The way to express the difference between *top/up* and *bottom/down* would have to change for obvious reasons, though *ring* from *ring*: *ring*– ‘rise, lift’ and *lesa* from *lesa*: *lesa*– ‘fall’, or *rota* from *rota*: *rota*– ‘heave (up)’ and *kosa* from *kosa*: *kosa*– ‘drop (down)’ would be good candidates from which to generate new adpositions. Alternatively, *saba* could become an equivalent of *manga* to indicate direction *from* the indicated place.

Since with prepositions the adverb comes after the nominal complement as in (114a), there may be potential ambiguity as to constituency, since adjectives and adverbs do not differ in form. One such case is illustrated in (115), where the A-type modifier  $\text{အဝေး}$  *baras* ‘rough(ly)’ may be interpreted either as an adverb modifying the adpositional phrase or as an adjective modifying the prepositional object. The individual words are copied again to the very bottom of the c-structure trees in (115) to highlight that different syntactic structures may lead to the same outcome on the surface.

Ambiguity can be resolved in these cases by subordinating the adjective to the noun explicitly with the relativizer  $\text{အဘယ်}$  *si*, as shown in (116). The relative clause, then, essentially means ‘which is ADJECTIVE’. The fact that it is somewhat hard to come up with an example is probably telling of the likelihood of such ambiguity. In either case, wrapping an adjective into a relative clause CP to explicitly subordinate it is always a permissible strategy of clarification. This also means in turn that adpositions cannot be modified by relative clauses, however, this should rarely be necessary, if it makes any sense at all.

- (115) *marin altanya baras*  
 marin altan-ya baras  
 in.front rock-LOC rough(ly)

‘roughly in front of the rock’  
 or: ‘in front of the rough rock’

or

- (116) *marin altanya si baras*  
 marin altan-ya si baras  
 in.front rock-LOC REL rough

‘in front of the rough rock’  
 literally: ‘in front of the rock which is rough’

It was mentioned initially that certain adpositions are also able to take clausal complements. This is especially the case for when adpositions are used to describe points in or stretches of time. A list of adpositions which can be used for this purpose is given in Table 4.17. Essentially, a subset of spatial prepositions can be used metaphorically to refer to time, just as in English.

- (117) *Gamaryang marin sa-sabaye ang Sipra.*  
 gamar=yang marin sa~saha-ye ang Sipra  
 manage=1SG.A before ITER~come-3SG.F A Sipra  
 ‘I’ll get it done before Sipra returns.’

Both *gamaryang* ‘I manage (it), I get (it) done’ and *sa-sabaye ang Sipra* ‘Sipra returns’ are complete sentences; the preposition *marin* ‘in front of, before’ ties them together and indicates the second part’s relationship to the first: the embedded clause expresses a future state which serves as the background for the action expressed by the matrix clause. The corresponding constituent structure of the PP is shown in (118).

In cases like (118), an adverbial modifier in the fashion of (114) would attach in the adjunct position as well, following the clausal complement. For the example above, this is not very awkward, because the embedded clause is very short and does not branch too deeply. For cases where the length or depth of the CP does produce an awkward result, however, it is possible to extrapose it with *da-* on the phrase’s head representing the missing complement, altogether structurally similar to (82). An example of this strategy is given in (119).

- (119) *Gamaryāng*    *da-marin*    *sirimang*  
 gamar=yāng    da=marin    sirimang  
 manage=1SG.A    such=before    straight  
  
*sa-sabayē*    *ang Sipra.*  
 sa~saha-ye    ang Sipra  
 ITER~come-3SG.F A    Sipra  
 ‘I will do it right before Sipra returns.’

## 5.4 Inflectional and verb phrases

In this section we will finally consider the way verbs operate with regards to morphosyntax. Verbs govern the relations of the various phrase types to each other and they are thus central to the formation of clauses. Just from looking at the numerous examples in the previous section, it should have become clear that Ayeri's preferred word order is verb-first, which opens up a few typological questions—first and foremost, whether Ayeri actually has a verb phrase, or in terms of generative grammar: whether it is configurational in this regard. As we have seen, Ayeri definitely has a constituent structure as far as NPs, APs, PPs, etc. are concerned. However, due to VSO word order, it is not obvious whether verb and object actually form a VP constituent together, since V and O are not adjacent to each other. Since Ayeri marks topics in terms of morphology, it will also be necessary to discuss how this mechanism works and how it relates to the notion of the subject.

A discussion of subject, topic, and configurationality is interesting also in that Ayeri's syntactic alignment was originally *inspired* by the Austronesian or Philippine alignment system. Tagalog, an Austronesian language of the Malayo-Polynesian branch, spoken mainly in the Philippines (Hammarström et al. 2017; Schachter and Otanes 1972), usually serves as the academic poster child in descriptions of this system. Ayeri departs from Tagalog's system in a number of ways, though, and very probably towards the more conventional; Austronesian alignment is not necessarily the best model to liken Ayeri's syntax to. It will nonetheless be informative to compare both systems based on the work of Kroeger (1991, 1993), who provides

an analysis of Tagalog's syntactic alignment at least roughly in terms of the LFG framework and describes some heuristics which may be helpful in establishing what is actually going on in Ayeri.<sup>16</sup>

Before launching on a discussion of typological aspects and the details of the syntactic makeup of verb/inflectional phrases, let us briefly consider the featural setup of finite verbs (non-finite verbs only have PRED).

(120)	...	I	(↑ PRED)	=	'...'
			(↑ TENSE)	=	{NPST, PST, RPST, NFUT, FUT, RFUT}
			(↑ ASP)	=	{PROG, HAB, ITER}
			(↑ MOOD)	=	{IRR, NEG, IMP, HORT}
			(↑ MOD)	=	{ability, desire, intention, permission, requirement, obligation, continuation}
			(↑ TOP CASE)	=	{A, P, DAT, GEN, LOC, INS, CAUS}
			(↑ TOP ANIM)	=	±
			((↑ SUBJ PRED)	=	'pro')
			(↑ SUBJ ANIM)	=	±
			(↑ SUBJ GEND)	=	{M, F, N, INAN}
			(↑ SUBJ NUM)	=	{SG, PL}
			(↑ SUBJ PERS)	=	{1, 2, 3}

As discussed in section 4.5, verbs can grammatically mark a large number of features. These are listed in (120). For tenses, Ayeri distinguishes an unmarked present tense from three degrees of past and future tense each (section 4.5.2). Furthermore, it marks a range of grammatical aspects, that is, progressive, habitative, and iterative (section 4.5.3), as well as various moods, namely, irrealis, negative, imperative, and hortative (section 4.5.4). Since its modal particles may be characterized as clitics, they can also be listed in terms of a feature MODALITY (section 4.5.5). Besides this, transitive finite verbs are obligatorily marked for the case and animacy of the clause's topic. Ayeri also uses a system of verb agreement which alternates between morphological agreement with full third-person NPs and pronominal clitics, which is why the feature (↑ SUBJ PRED) appears in brackets: it is only defined for pronominal clitics (sections 3.2.5, p. 89, and 4.5.1).

<sup>16</sup> As mentioned in the introductory chapter, I started Ayeri in late 2003—then still in high school and not knowing much about linguistics. Of course, I had to go and pick as a model the one alignment system which has long been “a notorious problem for both descriptive grammarians and theoretical syntacticians” to the point where it “sometimes seems as if Austronesian specialists can talk (and write) of nothing else” (Kroeger 2007: 41).

Table 5.2: Frequency of word order types  
(n = 1377; adapted from Dryer 2013a)

Order	Frequency	Percentage
SOV	565	41.0%
SVO	488	35.4%
VSO	95	6.9%
VOS	25	1.9%
OVS	11	0.8%
OSV	4	0.3%
Other	189	13.7%

#### 5.4.1 Typological considerations

As mentioned above, Ayeri's unmarked word order gives the verb first, and then, in decreasing order of bondedness to the verb, the phrases which make up the verb's arguments: subject (agent), direct object (patient), indirect object (dative), followed by adverbials in the genitive, locative, instrumental, and causative case. Ayeri's basic word order is thus VSO, a trait it has in common with about 7% of the world's natural languages according to Dryer (2013a) (compare Table 5.2).<sup>17</sup> Following the format of previous statements on word order typology, we can declare the generalization in (121), which is consistent also with previous observations on word order typology, where the head preceded the modifier. The head is here represented by the verb, the modifier by the object—like English, Ayeri is a VO language, thus. In addition to this, however, Ayeri regularly puts the verb as the head of the clause itself first.

- (121) a. Order of subject, object, and verb: VSO  
b. Order of verb and object: VO

It is commonly assumed that languages have a subject which occupies a certain position in the constituent structure—the predicate—and which commands a con-

<sup>17</sup> It may be noted here that the 'other' category is actually 'no dominant order' in the original, and that this is maybe not quite accurate for at least a few languages in the sample, for instance, German. The unmarked word order of declarative statements in German main clauses is SVO with the finite verb mandatorily occupying the second position (V2). This position is commonly analyzed as C<sup>0</sup> in German, however, since the non-finite content verb V<sup>0</sup> appears at the end of the clause when the C<sup>0</sup> position is occupied by an auxiliary or a modal (compare, for instance, Bresnan et al. 2016: 375–379, 447–450, and Fortmann 2006); subordinate clauses are verb-last. It is not uncommon to analyze German as an OV language with V2 tendencies.

stituent jointly formed by the verb and its dependents—the predication. An SVO sentence in English thus very generally looks like in (122) (compare the examples in Bresnan et al. 2016: 101–111).

However, Ayeri is a VSO language, so the question arises how the basic constituent structure should be diagrammed in tree form, since V and O are not adjacent. As an initial hypothesis one might assume that they cannot form a unit together, since S somehow stands in between the constituents it is supposed to command. A very first stab at diagramming would probably be to come up with a flat, non-configurational structure, all but lacking a VP, as shown in (123).

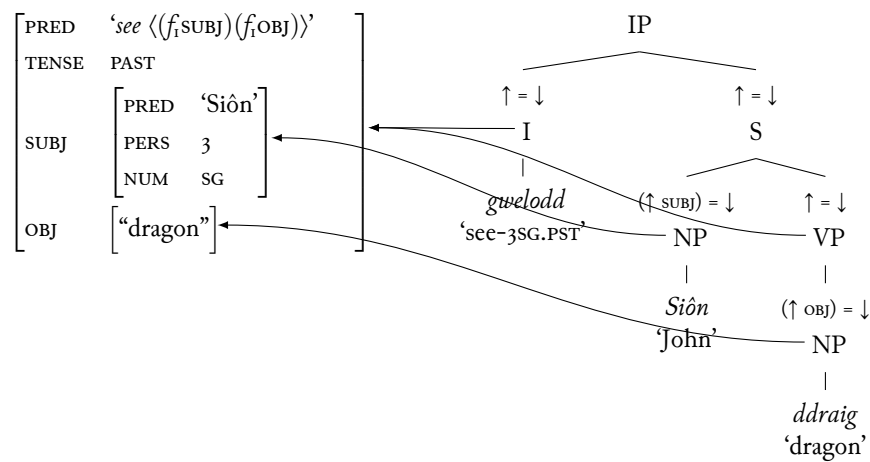

Such a structure, though, does not do Ayeri justice in that, for instance, right-node-raising of a subject and object NP together is possible, so there is evidence that they form a constituent subordinate to the verb. NP–XP constructions where XP is not a maximal projection of a verb also exist in isolation, so NP and XP are probably contained in a small-clause constituent S separate from the verb. The verb in the initial position furthermore shows inflection, so one might rather construe it as an  $I^0$ , projecting an IP, which frees up VP for other purposes while we can use IP to govern both  $I'$  and S. In fact, such a structure is basically the conclusion Chung and McCloskey (1987) come to for Irish, which is also a VSO language

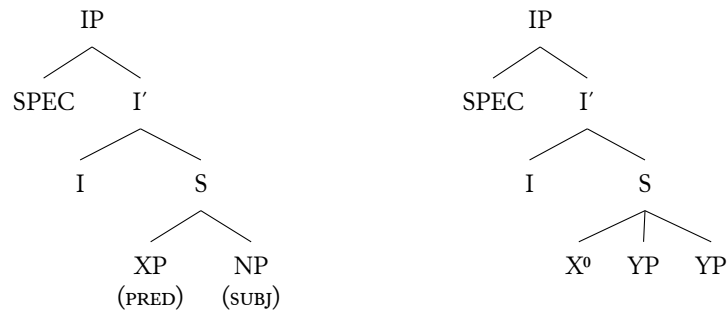

- (124) a. Irish (Chung and McCloskey 1987: 235):

- b. Welsh (adapted from Bresnan et al. 2016: 134):

- c. Tagalog (Kroeger 1991: 131):

(124a). Bresnan et al. (2016) give the chart in (124b) for Welsh, equally a VSO language (also compare Dalrymple 2001: 66, sourcing Sadler 1997). Kroeger (1991) suggests the two structures depicted in (124c) for Tagalog, based on the suggested constituent structure for Celtic languages.

What all of these c-structures have in common is that the inflected verb appears in  $I^0$ , which is a sister of S. S, in turn, is a small clause containing the arguments of

the verb. In the cases of Irish and Welsh, however, there is a VP sister of the subject NP which itself does not have a head, but contains the object NP as a complement. In the case of Tagalog, S is non-configurational, that is, while XP may contain a non-finite verb, the subject and object NPs are on equal footing.

Bresnan et al. (2016: 129–138) inform that the phenomenon of the verb ending up in a different head position ( $V^0$  apparently moves to  $I^0$ ) in (124b) is commonly known as ‘head movement’, except that LFG is built specifically without any movement. Since LFG is based on the assumption that all nodes in a syntactic structure are base-generated, that is, that there are no transformational rules generating the surface structure from a deeper layer of representation underneath it, there cannot be a trace of V left behind in VP. LFG avoids empty categories, as there is no information contained in an empty node. The functional information provided by the verb is not lost, however, it is merely now provided by the verb in  $I^0$ . Essentially, the Welsh example does not violate endocentricity, since the finite verb in  $I^0$  still forms the verbal head in the functional structure representation of the clause. With regards to constituent structure,  $V^0$ , if present, c-commands its NP sister; both  $V^0$  and NP are dominated by VP:

- (125) a. Exhaustive domination (Carnie 2013: 121):  
 “Node A exhaustively dominates a set of terminal nodes {B, C, ..., D}, provided it dominates all the members of the set so that there is no member of the set that is not dominated by A and there is no terminal node G dominated by A that is not a member of the set.”
- b. C-command (127):  
 “Node A c-commands node B if every node dominating A also dominates B, and neither A nor B dominates the other.”

The AVM in (124b) shows that the contents normally found in  $V^0$  are provided by the head of its equivalent functional category,  $I^0$ .  $I^0$  and VP are said to map into the same f-structure (Bresnan et al. 2016: 136). Endocentricity still holds in that IP dominates all nodes below it, thus also  $I^0$  and the object NP. In addition,  $I^0$  c-commands its sister node and all of its children, hence also the object NP. As Bresnan et al. (2016) put it: “X is an extended head of Y if X is the X’ categorial head of Y [...], or if Y lacks a categorial head but X is the closest element higher up in the tree that functions like the f-structure head of Y” (136). For our example, replace X with  $I^0$  and Y with VP in the second half of the quote:  $I^0$  is the closest element higher up in the tree that functions like the f-structure head of VP, which itself lacks a categorial head.

The analysis of the sentence structure of Celtic languages shows that VSO languages do not automatically need to be considered ‘non-configurational’ and lacking a VP if the notion of extended heads is accepted. In any case, tests need to be per-

formed to see whether one of the analyses presented in (124) holds true for Ayeri as well.

#### 5.4.2 ‘Trigger languages’

The notorious term ‘trigger language’ comes up in discussions on Conlang-L as early as 1995, where it may well have originated as an established term in the fictional-language community for what will be described below in brief. That is, I have not been able to find any earlier mentions of the term ‘trigger’ as referring to an alignment system in the archives; other mainstays of the fictional-language community, such as the ZBB, were established only about a decade later. In a message dated December 16, 1995, John Cowan writes that he wants “to propose a reform of Radilu, to make it use the Tagalog concept of a ‘trigger’” (Cowan 1995). By his definition, this entails that

each clause contains one noun phrase which is not marked for case, but rather has a distinct marking called the “trigger marker”. [...] The verb carries a marking (which of course looks nothing like the noun case markers) that tells the true case of the trigger. [...] This involves changing the name of “nominative” and “accusative” to “actor” and “patent” [*sic*], since there is no longer a “subject” or “object” as such. Of course, word order is free (Cowan 1995)

He also notes that “Usually the trigger is definite (Tagalog doesn’t have articles)” (Cowan 1995). Essentially, it seems that the motivation for Cowan’s system is that the ‘trigger’ indicates that a certain NP is definite. As we will see below, this is similar to how Tagalog marks one of its relations on the verb, with that relation being definite. Things are more complicated in reality, though. Especially the claim that Tagalog lacks subjects and objects is problematic. However, the term ‘trigger’ seems to have currency in that, for instance, Schachter (2015) chooses it explicitly to refer to the “non-case-marked argument” (1659). In a parenthetical remark he adds that some

previous treatments have referred to the argument in question as the *topic* and some as the *subject*. However, as will become clear below, each of these labels appears to carry some inappropriate connotation, making a neutral term like *Trigger* seem preferable [...] There also seems to be good reason to reject the term *focus*. (1659)

It may be noted that term ‘focus’ is used in Schachter and Otnes (1972), the main reference grammar of Tagalog. What is interesting in comparing Schachter (2015)’s and Kroeger (1991)’s respective analyses of Tagalog’s syntactic alignment is that both make the same observation in spite of coming to opposite conclusions: Tagalog is ambiguous as to whether the subject notion is vested in the NP whose role is marked on the verb or the actor, since certain syntactic constructions typically associated with subjects apply to either or both. While this ambiguity leads Schachter (1976, 2015) to ultimately conclude that Tagalog lacks a single unified

relation which can be analyzed as a syntactic subject,<sup>18</sup> Kroeger (1991) reaches the opposite conclusion by performing further tests and taking a functionalist rather than purely structuralist perspective. Thus, he concludes:

- “Tagalog has a well-defined grammatical subject” (225). What Schachter (1976) lists as evidence against are special cases which can be explained by the high semantic and pragmatic prominence of actors more generally (Kroeger 1991: 225). Tagalog basically applies the notion of a logical subject distinct from the syntactic subject to some constructions, though the syntactic subject is more important overall (36).
- “grammatical relations are defined independently of phrase structure” (225);
- “patients can become subjects even when the agent is expressed as a direct (non-oblique) argument of the verb” (225).
- “Subject selection in Tagalog does not work by demotion or suppression of thematically more prominent arguments. Rather, all arguments seem to be equally eligible for mapping onto the subject relation” (226).

Kroeger (1991) also provides evidence based on statistics and examples that the marked-for relation, which he classifies as being in the nominative case according to his hypothesis that it is the syntactic subject, is neither especially salient in terms of pragmatic topichood, nor does it show signs of carrying pragmatic focus specifically. He finds that rather, nominative marking works independent of discourse functions (56 ff.). All things considered, the term ‘trigger language’ is probably ill-fitting, not just for Ayeri.

The tests for typical properties associated with grammatical subjects which Kroeger (1991) performs partially extend those presented in Schachter (1976). Moreover, his conclusions build on a more modern, functionally oriented approach than Schachter’s. For this reason, I will follow Kroeger rather than Schachter. Either way, we will have to test verb agreement, syntactic pivot, relativization, control of secondary predicates, raising, and control.<sup>19</sup> First of all, it will be helpful, however, to define some terms which will be used in the discussion below.

<sup>18</sup> Cowan (1995)’s sketch may be based on Schachter (1976). Curiously, Schachter (2015) does not acknowledge Kroeger (1991) at all, nor does he refer to any other research more recent than 1985. The reason may be that Schachter retired in the early 1990s, as the UCLA linguistics department’s Department history (2017) suggests.

<sup>19</sup> The tests which Kroeger (1991) dismisses as irrelevant to determining subjecthood in Tagalog have been omitted here if they were also not profitable to answering this question for Ayeri. The same goes for a number of tests which are specific to the grammar of Tagalog and thus have no application in Ayeri.

- (126) a. nominative–accusative alignment (S/A—P):

- b. ergative–absolutive alignment (S/P—A):

### 5.4.3 Definition of terms

The terms ‘subject’, ‘topic’, and ‘focus’ were already used a number of times above, but it seems advisable to sketch out working definitions in order to preclude confusion before continuing to look at how *Ayeri* fares with regards to these notions. As we will see, all of subject, topic, and focus relate to different ways in which the relative prominence of certain NPs is raised; subject and topic are also closely related to each other. It ought to be noted that while LFG treats topic and focus as grammaticalized discourse functions outside of the argument-structure frame of a verb, it treats the subject as both a discourse function and an argument function; topic and focus, on the other hand, must be identified with a corresponding argument function (Bresnan et al. 2016: 99–100; also compare (1) above, p. 240).

#### *Subject*

First things first, the **subject** can be defined in a variety of ways, and maybe especially because the notion of a subject is so basic, Comrie (1989) notes that if

linguists were invariably in agreement in stating which noun phrase, in each construction in each language, is the subject, then we could, perhaps, accept this inter-subjective agreement, and devote correspondingly less energy to trying to find an explicit definition of subject. However, it turns out that, in a wide range of cases, this inter-subjective agreement is lacking. (104)

Dixon (2010) defines a subject as “the entity about which something is affirmed or denied” (76). He goes on to explain that, ignoring copula clauses like ‘We are tired and thirsty’, every language has two varieties of clauses, intransitive ones, where the verb has just one core argument, and transitive ones, where the verb has two core arguments. A basic definition based on this is given by the chart in (126).

It shows the definition of the notion of subject for both nominative–accusative languages and ergative–absolutive languages. Languages of the world differ based on how they prefer to treat the two nominal relations of a transitive verb in relation to intransitive verbs: they may have a strong preference to either treat the agent (A)—the entity that prototypically acts in some way—or the patient/undergoer/theme (P)—the entity which is prototypically affected by the action in some way—the same as S, the sole argument of an intransitive verb. In the former case, the language is said to have NOM–ACC alignment (126a) with S/A being the nominative subject, whereas in the latter case (126b), the language is said to have ERG–ABS alignment with S/P being the absolutive subject. Comrie (1989) illustrates this difference with an example from Chukchi, which we will here contrast with English:<sup>20</sup>

- (127) a. *I came*  
           ISG.NOM come.PST  
           S  
       b. *I saw her*  
           ISG.NOM see.PST 3SG.F.OBL  
           S/A P

(128) Chukchi (adapted from Comrie 1989: 104):

- a. *yəm tə-yet-yʔek*  
       ISG.ABS came-1SG  
       S  
       ‘I came.’  
       b. *yəm-nan yət tə-lʔu-yət*  
           ISG.ERG 2SG.ABS saw-1SG-2SG  
           A S/P  
       ‘I saw thee.’

While English treats the actor of the intransitive sentence (127a) the same as that of the transitive one (127b)—both sentences use *I* in the nominative—Chukchi appears to use a different pronoun for the actor of the intransitive sentence (128a) than the actor of the transitive one (128b)—absolutive *yəm* versus ergative *yəmnan*, respectively. At least in Standard English, it would be ungrammatical to use the pronoun *me* in place of *I* in (127b), since *me* can only be used for first-person objects of the verb, but not for subjects of transitive clauses.

However, Comrie (1989) also urges to consider that grammatical relations and their representation in morphology are not always as clear-cut as in the example above. While he characterizes the prototypical subject as the intersection of agent

<sup>20</sup> In English, *you* is the same for both singular and plural as well as subjective and objective case, which is why I replaced it with the unambiguous *her* in (127).

and topic as far as cross-linguistic evidence is concerned (Comrie 1989: 107), he also points out that subjects do not necessarily have to unite all the properties typically associated with them (110). This seems to be the case, with Tagalog, for instance, as observed by both Schachter (1976) and Kroeger (1991), and may considerably complicate making a definitive statement.

Moreover, Comrie (1989) points out that statistically, languages of the world show a strong preference for NOM–ACC alignment, possibly due to the fact that human perception values actors as more relevant to discourse than patients, which is why actors are far more likely also to be pragmatic topics (120). Yet, though, dominantly NOM–ACC-aligned languages may show a bias towards an ERG–ABS treatment, for instance, of resultative constructions. On the other hand, dominantly ERG–ABS languages show a bias towards a NOM–ACC treatment, for instance, of addressees of imperatives (116–119).

According to Carnie (2013), from the point of view of constituent structure (which is key in Generative Grammar), a subject is conventionally understood as a “DP that has the property indicated by the predicate phrase. What the sentence is about. In most sentences, this surfaces in the specifier of [the tense phrase]” (221). However, as we have seen above, this notion is challenged by languages such as Tagalog (Kroeger 1991: 225). What Carnie (2013) refers to in terms of constituent structure was basically already indicated by (122), except with different labels; the example is repeated here for convenience as (129). For systemic reasons, Carnie (2013) refers to a DP subject which serves as the specifier of a TP. This corresponds to the subject NP and the IP here. Unlike GG, LFG treats tense as a semantic feature, not as a functional head with a fixed position in constituent structure, hence the difference in labeling.

(130) Warlpiri (Bresnan et al. 2016: 325):

LFG defines a subject function, SUBJ. Which argument of the verb the subject is mapped onto is understood to be based on the relative prominence of the subject argument along some dimension compared to other arguments. For instance, NOM-ACC languages prefer the semantically most prominent available role of a verb's argument structure, ERG-ABS languages instead pick the argument most affected by the actor's action, and active languages focus on the argument in control of the action (Bresnan et al. 2016: 95–96). The mapping between grammatical functions like SUBJ and the lexical components that make it up also does not need to be a one-to-one correspondence, since LFG allows for the distributed exponence of grammatical features like in the example of Warlpiri in (130). The only condition is that grammatical functions be uniquely defined within their minimal f-structure (45). As (130) shows, multiple NPs in different positions in the constituent structure may feed semantic information to a single function defined by the argument structure of the verb.

The subject role  $\hat{\theta}$  is defined as “the most prominent semantic role of a predicator” (Bresnan et al. 2016: 330). Furthermore, Bresnan et al. (2016) devise two a-structure features,  $[\pm o]$  (objective) and  $[\pm r]$  (restrictive). According to this classification, SUBJ is assigned the features  $[-r, -o]$ , since the subject is not restricted to a certain semantic role, nor needs to have a semantic role.<sup>21</sup> Also, subjects do not complement transitive predicators like objects do, so they are not ‘objective’. Bresnan et al. (2016)’s lexical mapping theory assumes that all languages have subjects, which goes counter to Schachter (1976, 2015)’s claim that subjects are possibly not universal (Bresnan et al. 2016: 330–331).

<sup>21</sup> This ought to make Kroeger (1991)’s analysis compatible to LFG as well.

### Topic

The notion of **topic** refers essentially to who or what a longer stretch of conversation is about. Givón (1983) defines the topic of a ‘thematic paragraph’—as he calls a coherent unit of discourse above the level of a single sentence—as “the continuity marker, the *leitmotif*” (8). The topic is thus

the participant *most crucially involved* in the action sequence running through the paragraph; it is the participant most closely associated with the higher-level “theme” of the paragraph; and finally, it is the participant most likely to be coded as the *primary topic*—or grammatical subject—of the vast majority of sequentially-ordered clauses/sentences comprising the thematic paragraph. (8)

This indicates that topic and subject are closely related concepts, as already mentioned above in reference to Comrie (1989). Languages employ various means to indicate topics; right- and left-dislocation, as known from English, or topic-marking particles as in Japanese and Korean, are only two among many possibilities (Dixon 2010: 174).

Topicality also interfaces with definiteness in that chain-initial topics may be definite (already introduced into discourse) or indefinite (newly introduced into discourse), while chain-medial topics and chain-final topics are always expected to be definite (Givón 1983: 10). Dixon (2010: 171) adds that topic NPs are coreferential with arguments of clauses immediately preceding or following the current clause. Moreover, the strategy of passivization (in NOM–ACC languages) or of antipassivization (in ERG–ABS languages) exists, among others, in order to keep a certain discourse item persistent in the highly topical subject position even if it would otherwise be the object of the clause. This is related in turn to the notion of syntactic pivot in clause coordination (172).

### Focus

Regarding the definition of **focus**, Dixon (2010: 174) only mentions contrastive focus, which basically raises the prominence of a certain NP within a single clause. It is not necessary for the focussed NP to be coordinated with another NP by ‘or’. Dixon (2010) also warns that focus is often confused with topic. Perhaps this is in part also, as Bresnan et al. (2016) mention, due to the fact that English may use the topic position for either topic or focus under certain circumstances (98):

- (131) Q: What did you name your cat?  
A: ROSIE I named her. (*Rosie* = FOC)

The answer to a *wh*-question is considered focused, so *Rosie* in (131) is the focus in ‘I named her ROSIE’. However, in the example above, *Rosie* is fronted, which following Givón (1983), constitutes a disruptive action used to establish a new topic

of conversation: left-dislocation in languages with rigid SVO word order such as English is typically associated with low topic continuity, and left-dislocated NPs can be found most often as initiating a topic chain (32).

#### 5.4.4 Tests on subjecthood

As initially mentioned, Ayeri was originally conceived under an impression of what was described in the quote by Cowan (1995) above in terms of ‘trigger language’ (also compare Schachter 2015). That is, in simple declarative statements, the semantic macrorole of a definite NP is marked on the verb. This is itself a very basic account of what can be observed in Tagalog and other Philippine languages, compare (132) (emphasis mine).<sup>22</sup> Further effects will be discussed in more detail below.

(132) Tagalog (Kroeger 1991: 14, adapted from Foley and Van Valin 1984: 135):

- a. *B-um-ili ang=lalake ng=isda sa=tindaban.*  
 PFV.AV-buy NOM=man GEN=fish DAT=store  
 ‘The man bought fish at the store.’
- b. *B-in-ili-Ø ng=lalake ang=isda sa=tindaban.*  
 PFV-buy-OV GEN=man NOM=fish DAT=store  
 ‘The man bought *the fish* at the store.’
- c. *B-in-ilb-an ng=lalake ng=isda ang=tindaban.*  
 PFV-buy-DV GEN=man GEN=fish NOM=store  
 ‘The man bought fish *at the store*.’
- d. *Ip-in-am-bili ng=lalake ng=isda ang=pera.*  
 IV-PFV-buy GEN=man GEN=fish NOM=money  
 ‘The man bought fish *with the money*.’

The examples in (132) show variations on the same sentence, differing in the distribution of the definite NP which Kroeger (1991) classifies as being the subject of the respective sentence on syntactic grounds. The subject NPs are marked with the clitic *ang*, and their role in the clause is reflected by the voice marking on the verb (the root is *bili* ‘buy’): in (132a) the subject is the actor, in (132b) it is the object, in (132c) it is a location, and in (132d) it is an instrument. What is remarkable is that this voice marking goes beyond mere passivization,<sup>23</sup> so even the

<sup>22</sup> The underlining here is not supposed to be read as marking contrastive focus—this is one of the ‘mistakes’ that has led to what I have in Ayeri, basically, besides then also mixing up focus and topic.

<sup>23</sup> Note that Kroeger (1991) avoids the terms *active voice* and *passive voice* that Schachter (2015) objects to as inappropriate, even though what Tagalog does essentially appears to work along those lines, except in a more generalized way.

oblique arguments of (132cd) can become subjects of their respective clauses. Ayeri is at least superficially similar, compare (133).

- (133) a. *ang=int-ya ayon-Ø inun-ley moton-ya*  
 AT=buy-3SG.M man-TOP fish-P.INAN store-LOC  
 ‘The man, he bought fish at the store.’
- b. *le=int-ya ayon-ang inun-Ø moton-ya*  
 PT.INAN=buy-3SG.M man-A fish-TOP store-LOC  
 ‘The fish, the man bought it at the store.’
- c. *ya=int-ya ayon-ang inun-ley moton-Ø*  
 LOCT=buy-3SG.M man-A fish-P.INAN store-TOP  
 ‘The store, the man bought fish there.’
- d. *ri=int-ya ayon-ang inun-ley pangis-Ø*  
 INST=buy-3SG.M man-A fish-P.INAN money-TOP  
 ‘The money, the man bought fish with it.’

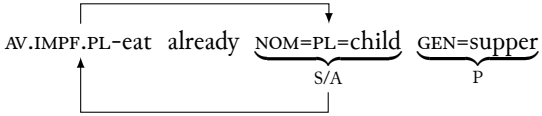

Like Tagalog, Ayeri marks a privileged NP on the verb, however, in Ayeri, this is the topic, not the subject (this will be subject to further scrutiny below). Unlike in Tagalog, the marked NP is not marked by a particle, but by the very absence of case marking on the NP itself. The marker corresponding to the role of the topic NP appears as a clitic in the shape of the corresponding NP’s case marker in its proclitic form at the left-most edge of the clause, before the verb (compare sections 4.1.3 and 4.5). While the marker on the verb is thus related to nominal case markers in Ayeri, Tagalog uses a number of affixes for voice marking which are not obviously related to case markers on nouns. For instance, non-subject actors are marked by the genitive clitic *ng* (pronounced *nang*), while actor voice is marked by *mag-* or *-um-* (Schachter and Otanes 1972: 74, 78; Kroeger 1991: 16–18). In Ayeri, on the other hand, non-topic animate agents are marked on NPs by *ḥḥ-ang* or *ḥḥ ang*, and animate agent-topics are marked on the verb by *ḥḥ ang* as well.

#### Verb agreement

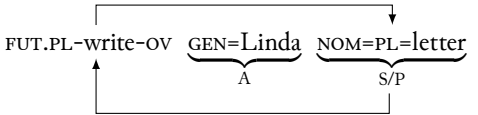

One of the most prominent features of Ayeri with regards to verbs and their relation to subjects is verb agreement with 3rd-person NPs. This was already discussed at length in section 3.2.5 (p. 89 ff.) and section 4.5. Hence, I will only give basic information here.

Kroeger (1991) mentions that Tagalog has optional plural agreement of predicates with the nominative NP if the nominative argument of the clause is plural. This is independent of whether the nominative argument is also the actor of the clause or not (24–25), compare (134). The arrows in (134) mark government and

(134) Tagalog (adapted from Kroeger 1991: 24–25, from Aspillera 1969: 122–123):

- a. *nagsisi-kain na ang=mga=bata ng=hapunan*  
 AV.IMPF.PL-eat already NOM=PL=child GEN=supper  

‘The children are eating their supper already.’

- b. *pagsu-sulat-in ni=Linda ang=mga=liham*  
 FUT.PL-write-OV GEN=Linda NOM=PL=letter  

‘Linda will write the letters.’

agreement relationships: the verb governs role and case assignment (top arrow), while the nominative NP controls plural agreement on the verb (bottom arrow). As the arrows illustrate, the relationship between the assignment of the subject role and thus nominative case and plural agreement on the verb are symmetric: the verb agrees in both (134a) and (134b) with the respective nominative NP, whether it is the agent (134a) or not (134b).

As described before, person agreement in Ayeri is essentially fixed to the agent NP in canonical cases, whether it is the topic of the clause or not. In (135a), we can see the verb determine that the agent argument is also the topic, with the verb agreeing itself in person with the agent: *ᐱᐱᐱᐱ Ajān* is a male name; the verb corresponds with masculine agreement. In (135b), however, the relation is asymmetric in that the marking on the verb shows that the patient argument is the topic, while the verb still displays masculine person agreement. We know that the verb agrees with *ᐱᐱᐱᐱ Ajān* rather than with *ᐱᐱᐱᐱ Pila* because the latter is a female name, so the verb should have feminine agreement if it were to agree with the patient NP. However, as the example shows, the verb continues to agree with the agent NP in spite of not being the topic of the clause. Topicalization appears to have no influence on the distribution of person agreement on the verb; the agent NP remains the subject. This is a very NOM–ACC trait.

In agentless clauses, however, the verb agrees with the patient argument, which makes Ayeri less typical a NOM–ACC language, and more similar in this regard to what an ERG–ABS language would be expected to do. Passivization of a transitive clause as a strategy for keeping the topic constant as a subject is essentially preempted by Ayeri’s use of a topic particle in the verb phrase. Hence, a sentence like (136a)—as

- (135) a. *Ang manya Ajān sa Pila.*  
 ang=man-ya Ø=Ajān sa=Pila

‘Ajān, he greets Pila.’

- b. *Sa manya ang Ajān Pila.*  
 sa=man-ya ang=Ajān Ø=Pila

‘Pila, Ajān greets her.’

- (136) a. <sup>?</sup> *Sa manye ang Ajān Pila.*  
 sa=man-ye ang=Ajān Ø=Pila

‘Pila, she is greeted by Ajān.’

- b. *Manye sa Pila.*  
 man-ye Ø=Pila  
 greet-3SG.F P=Pila

‘Pila is greeted.’

a parallel to (134b)—sounds odd, while (136b) is fine.

### Syntactic pivot

Since we have just dealt with aspects of syntactic alignment and found that Ayeri behaves a little oddly with regards to this, it may be interesting as well to perform another test on declarative statements and their syntactic pivot. A simple test which Comrie (1989: 111–114) devises in this regard is to test coreference in coordinated clauses. Commonly, in coordinated clauses, the subject of the second conjunct

(138) Dyirbal (adapted from Comrie 1989: 112):

- a. *balan drugumbil bangul yarangu balgan*  
       DET woman-ABS DET man-ERG hit  
       P A  
       ‘The man hit the woman.’
- b. *bayi yara baninru*  
       DET man-ABS came.here  
       S  
       ‘The man came here.’
- c. *balan drugumbil baninru*  
       DET woman-ABS came.here  
       S  
       ‘The woman came here.’
- d. *balan drugumbil bangul yarangu balgan, baninru*  
       DET woman-ABS DET man-ERG hit came.here  
       P A S  
       ‘The man hit the woman, and [the woman] came here.’

may drop out. Thus, in English, which behaves very much in terms of NOM-ACC alignment in this regard, we get the following result:

- (137) a. *The cat hunts the mouse.*  
       A P  
       b. *The cat comes here.*  
       S  
       c. *The mouse comes here.*  
       S  
       d. *The cat hunts the mouse and comes here.*  
       A P S

In the English example in (137), *the cat* constitutes the coreferential subject in (137d). This NP is the intransitive subject S of (137b) and the agent A of (137a). English thus typically has NOM-ACC alignment, since it treats S and A alike. In an ERG-ABS language, then, we would expect the opposite case: S and P should be treated alike. In Dyirbal, we find the situation depicted by the examples in (138).

In (138), we find that *balan drugumbil* ‘the woman’ is coreferential in (138d). This is the S of (138c), and the P of (138a). Dyirbal, thus, treats S and P alike, as predicted for an ERG-ABS language—at least in this case, since Comrie (1989:

(139) Tagalog (adapted from Kroeger 1991: 31, from Ramos and Cena 1990: 151–152):

- a. *tinanong ni=Derek si=Marvin, bago umalis*
- 
- PFV-ask-OV GEN=Derek NOM=Marvin before PFV.AV-leave S
- ‘Derek asked Marvin before [Marvin] left.’
- b. *nagtanong si=Derek kay=Marvin, bago umalis*
- 
- PFV.AV-ask NOM=Derek DAT=Marvin before PFV.AV-leave S
- ‘Derek asked Marvin before [Derek] left.’

113) also explains that 1SG and 2SG pronouns in Dyirbal behave in terms in terms of NOM–ACC. Comrie (1989) also notes that some languages do not show a clear preference for whether the A or P of the transitive clause in the first conjunct is the preferred reference of the S of the intransitive clause in the second conjunct.

For Tagalog, as Kroeger (1991) explains, “the deletion is not obligatory but null nominative arguments are always interpreted as referring to the nominative argument of the main clause” (30). Due to the way Tagalog treats subjects, however, the nominative argument can be formed by either NP in (139) with the voice marked accordingly on the verb.<sup>24</sup>

What can be observed in Tagalog is that in (139a), the dropped S argument in the second conjunct, *bago umalis* ... ‘before ... leaves’, is coreferential with *Marvin*, since he is marked as the subject of the first conjunct. Since *Marvin* is the theme (P) of *tanong* ‘ask’, the clause needs to be marked for objective voice. On the other hand, in (139b), it is *Derek* who is the subject of the clause, so it is also he who leaves; the verb in the first conjunct clause is marked for active voice according to the asker as the actor (A) being the subject.

In order to now investigate what the situation is in Ayeri, let us return to our initial set of examples. These examples feature two animals which are treated both

<sup>24</sup> Thus, compare the English passive sentence *Marvin<sub>i</sub> was asked by Derek<sub>j</sub> before he<sub>i</sub> left* with (139a). In English, the reference of *he* is ambiguous between the syntactic subject *Marvin* and the agent *Derek*, however. As we have seen above, though, Tagalog would also be able to make a subject of an oblique argument, not just of the patient/theme or the recipient. The actor of the Tagalog sentence is also basically an object, not demoted to an adverbial as in English (Kroeger 1991: 38–44).

as animate neuters. Anaphoric reference is thus potentially ambiguous between  $\text{ᠠᠨᠭᠤᠰᠠᠨᠠᠨᠠᠨ}$  *paral* ‘cat’ and  $\text{ᠠᠨᠭᠤᠰᠠᠨᠠᠨᠠᠨ}$  *prabara* ‘mouse’.

- (140) a. *Ang kimbyo paral prabarās.*  
 ang=kimb-yo paral-Ø prabara-as  
 AT= hunt-3SG.N  $\underbrace{\text{cat-TOP}}_A$   $\underbrace{\text{mouse-P}}_P$   
 ‘The cat hunts the mouse.’
- b. *Sahayo paralang edaya.*  
 saha-yo paral-ang edaya  
 come-3SG.N  $\underbrace{\text{cat-A}}_S$  here  
 ‘The cat comes here.’
- c. *Sahayo prabarāng edaya.*  
 saha-yo prabara-ang edaya  
 come-3SG.N  $\underbrace{\text{mouse-A}}_S$  here  
 ‘The mouse comes here.’
- d. *Ang kimbyo paral prabarās nay sahayong edaya.*  
 ang=kimb-yo paral-Ø prabara-as nay saha=yong edaya  
 AT= hunt-3SG.N  $\underbrace{\text{cat-TOP}}_A$   $\underbrace{\text{mouse-P}}_P$  and come=3SG.N.A  $\underbrace{\text{here}}_S$   
 ‘The cat, it hunts the mouse, and it comes here.’

While it is possible in Ayeri to not repeat the coreferential NP in a conjunct clause verbatim, Ayeri still appears to avoid an empty subject slot. Thus, the verb  $\text{ᠰᠠᠬᠠᠶᠣᠩ}$  *sahayong* ‘it comes’ in (140d) displays a pronominal clitic,  $\text{ᠶᠣᠩ}$  *-yong* ‘it’, which constitutes the resumptive subject pronoun of the clause. In (140d) at least, this pronoun is coreferential with the subject in the first conjunct,  $\text{ᠠᠨᠭᠤᠰᠠᠨᠠᠨᠠᠨ}$  *paral* ‘cat’. Seeing as Tagalog switches the subject around by altering the voice marking on the verb, it is certainly illustrative to check how Ayeri fares if the topic is swapped to  $\text{ᠠᠨᠭᠤᠰᠠᠨᠠᠨᠠᠨ}$  *prabara* ‘mouse’.

- (141) *Sa kimbyo paralang prabara nay sahayong edaya.*  
 sa= kimb-yo paral-ang prabara-Ø nay saha=yong edaya  
 PT=hunt-3SG.N  $\underbrace{\text{cat-A}}_A$   $\underbrace{\text{mouse-TOP}}_P$  and come=3SG.N.A  $\underbrace{\text{here}}_S$   
 ‘The mouse, the cat hunts it, and it comes here.’

In (141), the resumptive pronoun is indicated to not refer to the first conjunct’s agent/subject,  $\text{ᠠᠨᠭᠤᠰᠠᠨᠠᠨᠠᠨ}$  *paral*, but to its theme/object,  $\text{ᠠᠨᠭᠤᠰᠠᠨᠠᠨᠠᠨ}$  *prabara*. This may be explained by topicalization: the sentence is about the mouse, so the underspecified

- (142) a. *Yam ilya ang Akan ilonley Maran nay sarayāng.*  
 yam= il-ya ang=Akan ilon-ley Ø= Maran nay sara=yāng  
 DATT=give-3SG.M A= Akan present-P.INAN TOP=Maran and leave=3SG.M.A  
 ‘Maran, Akan gives him a present, and he leaves.’ (Maran leaves)
- b. *Na pahya ang Maran ilonley Diyan nay sarayāng.*  
 na= pah-ya ang=Maran ilon-ley Ø= Diyan nay sara=yāng  
 GENT=take.away-3SG.M A= Maran present-P.INAN TOP=Diyan and leave=3SG.M.A  
 ‘Diyan, Maran takes the present away from him, and he leaves.’ (Diyan leaves)
- c. *Ya babaya ang Diyan Maran nay sarayāng.*  
 ya= baha-ya ang=Diyan Ø= Maran nay sara=yāng  
 LOCT=baha-3SG.M A= Diyan TOP=Maran and leave=3SG.M.A  
 ‘Maran, Diyan shouts at him, and he leaves.’ (Maran leaves)
- d. *Ri su-sunca ang Diyan ilonley Sedan nay sarayāng.*  
 ri= su~sunt-ya ang=Diyan ilon-ley Ø= Sedan nay sara=yāng.  
 INST=ITER~claim-3SG.M A= Diyan present-P.INAN TOP=Sedan and leave=3SG.M.A  
 ‘Sedan, Diyan reclaims the present with his help, and he leaves.’ (Sedan leaves)
- e. *Sā pinyaya ang Maran tatamanyam Sedan nay sarayāng.*  
 sā= pinya-ya ang=Maran tataman-yam Ø= Sedan nay sara=yāng  
 CAUT=ask-3SG.M A= Maran forgiveness-DAT TOP=Sedan and leave=3SG.M.A  
 ‘Sedan, he makes Maran ask for forgiveness, and he leaves.’ (Sedan leaves)

argument in the second conjunct, in absence of topic marking that would indicate otherwise, corresponds to the topic. Interestingly, the result is structurally similar to the example of Tagalog in (139) above. It is too early yet, however, to conclude that what was called ‘topic’ so far is the subject; Ayeri is merely not completely unambiguous in this context. Since Tagalog allows any NP of a clause to be the subject, as illustrated by (132), let us test whether the behavior just described for Ayeri also holds in other contexts of topicalization. The following example presents sentences of differently case-marked topic NPs each, but in every case, the agent NP and the topicalized NP consist of a human referent. Both referents share the same person features so that the verb in the coordinated intransitive clause can theoretically license either of them as its antecedent.

In each of the sentences in (142), it is the topicalized NP which is identified as the antecedent for *sarayāng* ‘he leaves’. Does this mean Ayeri does, in fact, use Austronesian alignment? While the above examples certainly suggest it, let us not forget that the verb in the coordinated clause could theoretically pick either the agent NP or the topicalized NP as its controller. Things look slightly different,

- (146) a. *Ang tinisaya Lita sa Kumang nay sarayāng.*  
 ang=tinisa-ya Ø=Lita sa=Kumang nay sara=yāng  
 AT= hug-3SG.M TOP=Lita P=Kumang and leave=3SG.M.A  
  
 'Lita, he hugs Kumang, and he leaves.'
- b. *Ang tinisaya Lita sa Kumang nay sarayeng.*  
 ang=tinisa-ya Ø=Lita sa=Kumang nay sara=yeng  
 AT= hug-3SG.M TOP=Lita P=Kumang and leave=3SG.F.A  
  
 'Lita, he hugs Kumang, and she leaves.'

In cases where the topic in the first conjunct can safely be ruled out as the controller of the pronominal in the second conjunct, the syntactic pivot, thus, defaults to the highest-ranking semantically coherent NP. In most cases, Ayeri will therefore group the intransitive subject and the transitive agent together. For most verbs, this is also reflected by case marking, as we have seen above in (140): the S of an intransitive clause receives the same case marker as the A of a transitive clause: *ᐱᐱᐱ -ang/ᐱᐱᐱ ang* for animate referents, and *ᐱᐱᐱ reng/ᐱᐱᐱ eng* for inanimate referents (compare section 4.1.3). The case described initially, where the topic marking basically determines the controller of the coordinated intransitive clause, which is reminiscent of Tagalog's syntax, is essentially a strategy to disambiguate between two possible controllers for the same target.

When only one of the referents in the transitive conjunct is eligible as the controller of the subject of the intransitive conjunct at the same time, A and P are regularly indicated by person agreement, since Ayeri requires a resumptive pronominal clitic in the intransitive clause, as indicated above. The affix on the verb thus has the status of a pronominal predicator, compare (146).

In (146a), the verb in the second conjunct, *ᐱᐱᐱᐱ sarayāng* 'he leaves' is marked for a masculine third-person subject. The only available controller in the first conjunct is *ᐱᐱᐱ Lita* on behalf of being male, since *ᐱᐱᐱ Kumang* is female. Hence, in (146b) the verb of the intransitive conjunct, *ᐱᐱᐱ sarayeng* 'she leaves', finds its controller only in *ᐱᐱᐱ Kumang*.

*Quantifier float*

Another property usually associated with subjects is the ability of quantifiers referring to the subject NP to ‘float’ into the VP. This is possible also in English, consider, for instance:

- (147) a. *All the children are writing letters.*  
 b. *The children are all writing letters.*

Both of these sentences are equal in meaning: for all children in the set, every child is writing an unspecified amount of letters. It is not the case in (147b) that for an unspecified amount of children, together they write the total amount of letters. *All* refers to *the children* in both cases, even though *all* is not placed in the subject NP, *the children*, in (147b). Kroeger (1991) mentions an example from Schachter and Otnes (1972) concerning *labat* ‘all’, which is also able to float into a position right after the sentence-initial verb from the NP it normally modifies and which it would normally occur in:

(148) Tagalog (adapted from Kroeger 1991: 22, from Schachter and Otnes 1972: 501):

- a. *sumusulat labat ang=mga=bata ng=mga=libam*  
 AV.IMPF-write all NOM=PL=child GEN=PL=letter  
 ‘All the children are writing letters.’  
 Not: \*‘The children are writing all the letters.’
- b. *sinusulat labat ng=mga=bata ang=mga=libam*  
 IMPF-write-OV all GEN=PL=child NOM=PL=letter  
 ‘The/some children write all the letters.’  
 Not: \*‘All the children are writing letters.’

In (148a), *labat* ‘all’ refers to the children, which constitute the subject NP according to voice and case marking, while we get the opposite case in (148b), where it refers to the letters, which are marked as the subject this time. Of course, it is equally possible in English to say *The letters are all written by the children*, where *the letters* is the subject that the floated *all* refers to.

As pointed out in section 4.6.2, a lot of clitic quantifiers in Ayeri have a double meaning as intensifiers. For instance, ᐃᐱᐱᐱ -*ikan* can refer to both quantities and qualities, meaning ‘much, many’ or ‘very’ depending on context. Thus, many of the suffixed quantifiers, if appended to the VP, are understood to modify the verb as an intensifier and are thus unsuitable for floating. The only exception is ᐃᐱᐱᐱ -*aril* ‘some’, which only pertains to NPs as a quantifier. However, since the floating of suffixed quantifiers would produce readings which are ambiguous at best, floating of ᐃᐱᐱᐱ -*aril* is avoided as well. Example (149) shows an attempt to float ᐃᐱᐱᐱ -*ben* ‘all’

into the IP, resulting in a meaning different from the sentence with the unfloated particle for the reasons just stated above.

- (149) a. *Ang tabanyan ganye-ben tamanyeley.*  
 ang=tahan-yan gan-ye-Ø=hen taman-ye-ley  
 AT= write-3PL.M child-PL-TOP=all letter-PL-P.INAN  
 ‘The children, all of them are writing letters.’  
 b. <sup>1</sup>*Ang tabanyan-ben ganye tamanyeley.*  
 ang=tahan-yan=hen gan-ye-Ø taman-ye-ley  
 AT= write-3PL.M=completely child-PL-TOP letter-PL-P.INAN  
 ‘The children, they are completely writing letters.’  
*Intended:* ‘The children, they are all writing letters.’

Besides suffixed quantifiers, Ayeri also has free quantifiers like  $\text{ᑭᑭ}$  *sano* ‘both’ or  $\text{ᑭᑭᑭ}$  *diring* ‘several’, however. These free morphemes only have a quantifying reading, not an intensifying one, and are thus suitable for floating, since they do not produce ambiguities with regards to what is being modified.

- (150) a. *Ang apayan yan sano layjya.*  
 ang=apa-yan yan-Ø sano lay-ye-ya  
 AT= laugh-3PL.M boy-TOP both girl-PL-LOC  
 ‘The boys, both of them are laughing at the girls.’  
 b. *Ang apayan sano yan layjya.*  
 ang=apa-yan sano yan-Ø lay-ye-ya  
 AT= laugh-3PL.M both boy-TOP girl-PL-LOC  
 ‘The boys, they are both laughing at the girls.’

Since, as described above, topicalization has no impact on what constitutes the subject, meaning does not significantly change when the topic of a sentence like (150b) is switched to the patient in example (151a). Unlike in Tagalog in (148b) above,  $\text{ᑭᑭᑭ}$  *yanang* ‘boy(s)’ as the agent NP remains as the subject, and the floated  $\text{ᑭᑭ}$  *sano* still refers to this NP rather than the locative NP,  $\text{ᑭᑭᑭ}$  *layye* ‘(at) the girls’. This fact is also reflected in the lack of plural marking on  $\text{ᑭᑭᑭ}$  *yanang*, since  $\text{ᑭᑭ}$  *sano* indicates the NP’s plurality. We would expect the forms  $\text{ᑭᑭᑭᑭ}$  *yanjang* and  $\text{ᑭᑭᑭᑭ}$  *lay* if  $\text{ᑭᑭ}$  *sano* were to refer to ‘the girls’ rather than ‘the boys’, as in (151b).

- (151) a. *Ya apayan sano yanang layye.*  
 ya= apa-yan sano yan-ang lay-ye-Ø  
 LOCT=laugh-3PL.M both boy-A girl-PL-TOP  
 ‘The girls, the boys are both laughing at them.’

- b. *Ya apayan yanjang lay sano.*  
 ya= apa-yan yan-ye-ang lay-Ø sano  
 LOCT=laugh-3PL.M boy-PL-A girl-TOP both  
 ‘The girls, the boys are laughing at both of them.’

As we have seen above, the modification of subject pronouns with clitic quantifiers is avoided due to many of them serving a double role as intensifiers with related meanings which could be readily understood as referring to the verb instead of the pronoun. With free quantifiers, this problem does not arise, however, so that there is no problem in placing them right after the finite verb. Ambiguity may be in the phrase structure of the clause here, but not at a functional level, as it is clear that the quantifier modifies the subject pronoun from semantic coherence.

- (152) *Ang girenjan sano bahalanya.*  
 ang=girend=yan.Ø sano bahalan-ya  
 AT= arrive=3PL.M.A both finish-LOC  
 ‘They arrived both at the finish.’

As mentioned in section 4.2.6, it is possible for pronouns to be modified by enclitic intensifiers indirectly by using *ṣitang* ‘self’ as an indeclinable dummy pronoun to carry the clitic so as to avoid ambiguity created by floating the clitic right after the finite verb. This is also possible for the purpose of quantification of pronouns with clitic quantifiers.

- (153) a. *Ang girenjan panca sitang-hen bahalanya.*  
 ang=girend=yan.Ø panca sitang=hen bahalan-ya  
 AT= arrive=3PL.M.A finally self=all finish-LOC  
 ‘All of them finally arrived at the finish.’  
 b. *Ya girendtang panca sitang-hen bahalan.*  
 ya= girend=tang panca sitang=hen bahalan-Ø  
 LOCT=arrive=3PL.M.A finally self=all finish-TOP  
 ‘The finish, all of them finally arrived there.’

Since *ṣitang* is indeclinable, it is the pronominal clitic which carries inflection for case, as (153b) shows. An analysis of *ṣitang-hen* as ‘self.TOP=all’ is therefore not possible. Moreover, *ṣitang-hen* does not constitute a clitic cluster, because it is possible to place word material between the verb and *ṣitang-hen*, as (153) shows. The question remains, however, whether *ṣitang-hen* is stranded at the end of the verb phrase or located in the position a full agent NP would normally occupy. There will be further tests to this end in section 5.4.5.

### Relativization

Kroeger (1991) observes that in Tagalog, only nominative arguments may be relativized. He refers to Keenan and Comrie (1977)'s accessibility hierarchy of NPs, according to which, he reports, "if only a single argument of any clause can be relativized, that argument must be the subject" (Kroeger 1991: 24). That is, the argument in the main clause which is modified by a relative clause must be the nominative argument, and there must not appear an overt nominative argument in the relative clause itself. The verb in the relative clause carries inflection for the role of the relativized argument in the relative clause. Thus, (154a) is grammatical, while (154b) is not.

(154) Tagalog (Kroeger 1991: 24, from Foley and Van Valin (1984: 141–142)):

- a. *bata=ng b-in-igy-an ng=lalake ng=isda*  
 child=LNK PFV-give-DV GEN=man GEN=fish  
 'the child which was given fish by the man'
- b. \**isda=ng nag-bigay ang=lalake sa=bata*  
 fish=LNK AV-PFV-give NOM=man DAT=child

Ayeri, however, has no such restrictions. Non-topic NPs may be relativized, and relative clauses not uncommonly contain their own agent NP. The relativized NP may even be referred to in the relative clause by a resumptive pronoun or pronominal clitic, since verbs must not go uninflected. Since all NPs are accessible for relativization, it is not a suitable criterion for testing subjecthood.

- (155) *Ang ilya inunley ganyam inunaya si gumasayāng edaya.*  
 ang=il-ya inun-ley gan-yam inunaya-Ø si gum-asa=yāng edaya  
 AT= give-3SG.M fish-P.INAN child-DAT fisherman-TOP REL work-HAB=3SG.M.A here  
 'The fisherman who used to work here, he gave fish to the child.'

In (155), *inunaya* 'the fisherman', is both the topic of the clause and modified by a relative clause. He is referenced anaphorically by the 3SG.M.A suffix *-yāng* on the verb in the relative clause, since he is the actor in both. However, as the next examples show, these circumstances are not requirements for grammatical statements.

- (156) a. *Ang ilya inunaya inunley ganyam si ang pyabasaye*  
 ang=il-ya inunaya-Ø inun-ley gan-yam si ang=pyab-asa=ye.Ø  
 AT= give-3SG.M fisherman-TOP fish-P.INAN child-DAT REL AT= pass.by-HAB=3SG.F.TOP  
*benanya-ben.*  
 benan-ya=hen  
 morning-LOC=every  
 'The fisherman, he gave fish to the child which passes by every morning.'

- b. *Ang ilya inunaya ganyam inunley si petigayāng biro.*  
 ang=il-ya inunaya-Ø gan-yam inun-ley si petiga=yāng hiro  
 AT= give-3SG.M fisherman-TOP child-DAT fish-P.INAN REL catch=3SG.M.A freshly  
 ‘The fisherman, he gave fish which he caught freshly to the child.’

In (156a), the recipient NP *ganyam* ‘to the child’ is not the topic of the clause, but it is modified by a relative clause anyway. The relativized NP is again represented within the relative clause by means of verb morphology. The topic marker on the verb identifies the person suffix on the verb as the clause’s topic. In (156b), it is likewise not the topic NP which is relativized, but the patient NP *inunley* ‘fish’. This NP, however, is not represented in the relative clause because the verb does not inflect for the role of the patient, which the relativized NP carries in the relative clause as well. There is no morphology to alter the voice of the verb in such a way that the matrix clause’s patient NP becomes the subject of the relative clause.

- (157) *Ang ilya inunaya ganyam inunley si biro nay lepan.*  
 ang=il-ya inunaya-Ø gan-yam inun-ley si hiro nay lepan  
 AT= give-3SG.M fisherman-TOP child-DAT fish-P.INAN REL fresh and tasty  
 ‘The fisherman, he gave fish which is fresh and tasty to the child.’

Relative clauses in Ayeri may even just consist of a predicative adjective, as (157) illustrates. In these cases, there is no case-marked noun or topic contained in the relative clause.

#### Control of secondary predicates

Secondary predicates in Tagalog are interesting insofar as depictive adjectives which occur after the verb always modify the nominative argument:

- (158) Tagalog (adapted from Kroeger 1991: 29–30):

- a. *naghain na lasing si=Maria ng=isda*  
 AV.PFV-serve LNK drunk NOM=Maria GEN=fish  
 ‘Maria served the fish drunk.’ (Maria was drunk)
- b. *inibain na hilaw ni=Maria ang=isda*  
 IV.PFV-serve LNK raw GEN=Maria NOM=fish  
 ‘Maria served the fish raw.’ (The fish was raw)

- c. <sup>2</sup> *inibain na lasing ni=Maria ang=isda*  
 IV.PFV-serve LNK drunk GEN=Maria NOM=fish  
 'Maria served the fish drunk.' (The fish was drunk)

Kroeger (1991: 30) explains that (158c) is anomalous, since the subject is indicated as *ang isda* 'the fish', however, *lasing* 'drunk' is not a property usually associated with fish—it would fit better with 'Maria'. However, this interpretation would be ungrammatical since 'Maria' is not the subject of the clause.

Secondary predicates in Ayeri also follow the finite verb, and they refer to the agent. If what was identified as the topic would be the subject like in Tagalog, thus, the reference of the adjective should change in the way shown in (158). However, as we will see below, this is not the case.

- (159) a. *Ang kongaye gino Migray sangalya.*  
 ang=konga-ye gino Ø=Migray sangal-ya  
 AT=enter-3SG.F drunk TOP=Migray room-LOC  
 'Migray, she enters the room drunk.' (Migray is drunk)
- b. *Ya kongaye gino ang Migray sangal.*  
 ya=konga-ye gino ang=Migray sangal-Ø  
 LOCT=enter-3SG.F drunk A=Migray room-TOP  
 'The room, Migray enters it drunk.' (Migray is drunk)

In (159a), the topic NP, *ᄃᄃᄃ Migray*, happens to be the same NP that is modified by the secondary predicate, *ᄃᄃᄃ gino* 'drunk': Migray is drunk. However, (159b) generates the same reading even though this time, *ᄃᄃᄃ sangal* 'the room' is marked as the topic of the clause. A reading in which the room is drunk cannot be forced by morphological means, although it needs to be pointed out that predicative adjectives relating to the object inhabit the same postverbal position. Considering structure alone, the sentence in (159b) is ambiguous, though context certainly favors the reading provided in the translation of (159b), since 'drunk' is not typically a property of rooms.

- (160) *Ang ginya sati Niyas kangaley.*  
 ang=gin-ya sati Ø=Niyas kanga-ley
- 
- AT=drink-3SG.M cold TOP=Niyas milk-P.INAN
- ‘Niyas, he drinks milk cold.’ (The milk is cold)

Different than in (159), the adjective in (160), *sati* ‘cold’, refers to the object of the clause, *ႼႱႱႱ kangaley* ‘milk’, even though *ႼႱႱႱ kangaley* is not the topic of the clause. By structure alone, Niyas could also be the one who is cold, rather than the milk, however, this would be unlikely considering context and extralinguistic experience. Equally unlikely is the possible interpretation of the milk becoming cold by *ႼႱႱ Niyas*’ drinking it.

Different than in Tagalog, thus, it is not morphology but the meaning of the verb which determines whether the postverbal predicative adjective refers to the agent or the patient.<sup>25</sup> However, since in Ayeri, the predicative adjective following the verb can refer to either the agent or the patient depending on context, this test does not have a very clear outcome. At least we could establish here that alternations in the morphological marking of the privileged NP—tentatively, the topic—has no impact on the relation between adjective and noun. The marking on the verb is thus not used for manipulating grammatical relations in this context, unlike in Tagalog.

### Raising

Raising verbs involve the sharing of the subject of an embedded clause with the structural subject or object position of its matrix clause; the complement clause’s subject appears as a gap in English. The raised subject is not semantically an argument of the matrix clause’s verb. The matrix clause’s subject may also be a dummy ‘it’ or ‘there’ in English.

- (161) a. It seemed that John<sub>i</sub> knows the answer.  
 b. John<sub>i</sub> seemed <sub>i</sub> to know the answer.  
 c. \*John<sub>i</sub> seemed it.
- (162) a. I expected that Linda<sub>i</sub> sings the national anthem.  
 b. I expected Linda <sub>i</sub> to sing the national anthem.  
 c. <sup>1</sup>I expected Linda.

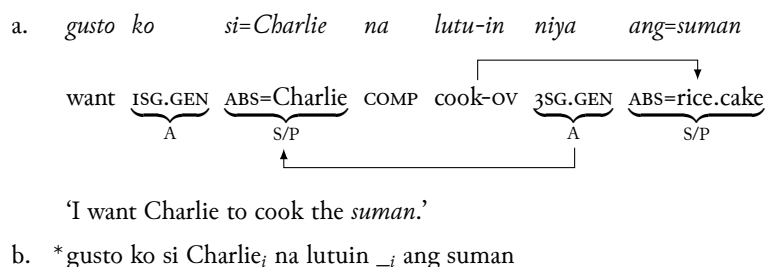

<sup>25</sup> Unfortunately, Kroeger (1991) does not provide any examples of object predicatives in Tagalog, and neither does Schachter and Otnes (1972) readily contain information on these.

Kroeger (1991: 27–28) states that, as expected, raising is restricted to nominative arguments in Tagalog. Non-nominative actors may be raised into the matrix clause as well, however, but at least for some speakers there needs to be a resumptive pronoun—basically, an overt pronominal ‘trace’ in terms of GG—in the complement clause, as shown in (164). Example (163) shows a case of raising of the nominative argument of the complement clause to the patient of a transitive verb; the nominative argument of the complement clause subsequently is realized as a gap coindexed with the patient of the matrix clause, that is, the raised argument. In English, one would speak of to-object raising, though here the patient of *gusto*, *silá*, is in its nominative form, so syntactically, *ng Nanay* ‘mother’, the actor, is the object in this clause. In (164a), the verb of the complement clause, *lutuín* ‘cooks’, marks its patient argument as the subject. Yet, the non-subject agent, *Charlie*, is raised to occupy the patient role in the matrix clause. The position of the non-subject agent in the complement clause is subsequently realized as a resumptive pronoun, *niya*, coindexed with the raised NP. Example (164b) shows that it would be ungrammatical to have a gap in its stead.

(163) Tagalog (adapted from Kroeger 1991: 26):

(164) Tagalog (adapted from Kroeger 1991: 28):

Kroeger (1991) presumably switches to labeling the raised NP as ABS in (164) because it is the patient-subject of *gusto* ‘want’ (note the actor *ko* occurs in genitive case); the patient of the embedded clause, *suman* ‘rice cake’, is also marked as a

- (165) a. *Surpreng* *ang koronye Pada guratanley* [<sub>CP</sub> *ang koronye Pada guratanley* ].

- d. \**Surpye ang Pada.*  
 surp-ye ang=Pada  
 seem-3SG.F A= Pada  
 ‘Pada seems.’

subject with the verb indicating this by object-voice marking. This is basically consistent with how an ERG–ABS language would mark subjects. Unfortunately, Kroeger (1991) only gives examples of ‘to-patient’ raising, but not of ‘to-actor’ raising (Carnie 2013: 430). As we will see below, Ayeri has no problem with the former (as to-subject raising), however, it cannot do the latter (as to-object raising), probably for semantic reasons. First of all, let us look at to-subject raising, however.

In (165), *Pada* is both the topic and the subject of *koron-* ‘know’, but not of *surp-* ‘seem’, as (165d) shows. However, *Pada* can be made the subject of the matrix clause, as shown in (165b). Raising results in an intransitive matrix clause, which means that topicalizing the only argument of the verb is blocked, as illustrated by the ungrammaticality of (165c). The verb in (165b) also becomes non-finite, like in English. Unlike in Tagalog, it cannot carry any marking for grammatical relations. Furthermore, it is possible in Ayeri to form a complex predicate like *surp-koronyam* in (166), literally ‘seems knowing’, with all of the arguments of the embedded clause becoming arguments of the matrix clause, that

- (166) *Ang surpye* [s *koronyam*] *Pada* *guratanley.*  
 ang=surp-ye koron-yam Ø=Pada guratan-ley
- A=seem-3SG.F      A      know-PTCP      P      TOP=Pada      S/A      answer-P.INAN      P
- ‘Pada, she seems to know the answer.’

- (167) Tagalog (adapted from Kroeger 1991: 26):

- a. *malapit na si=Manuel na hulihin ng=polis*  
 NVOL-close already NOM=Manuel COMP catch-OV GEN=police  
 S      A      S/P
- ‘Manuel is about to be arrested by the police.’
- b. *napagbintangan ang=pangulo=ng sinubulan ng=Sindikato*  
 NVOL.PFV-accuse-DV NOM=president=COMP PFV-bribe-DV GEN=syndicate  
 S      A      S/P
- ‘The president was accused of having been bribed by the Syndicate.’

is, the matrix verb is interpreted as a transitive clause and may carry topic marking for any of its syntactic (rather than semantic) arguments.

If the topic is actually the subject, it should be possible in Ayeri to raise non-actor topics into the matrix clause easily. Of course, this is possible in Tagalog. In (167a), thus, *Manuel* is the one arrested, so he is the patient of the subordinate clause which acts as the subject of the matrix clause. The fact that *Manuel* is a patient-subject of the subordinate verb, *hulihin* ‘be caught’, is reflected in its being marked for objective voice. The English translation is consequently given with the subordinate clause phrased in the passive voice. Similarly, in (167b), the subordinate verb, *sinubulan* ‘be bribed’, is marked for directional voice. According to this, *ang pangulo* ‘the president’ is a non-actor subject of the subordinate verb here as well. It also is in the matrix clause, since the matrix verb, *napagbintangan* ‘be accused of’, is marked for directional voice.

As we have seen above, the marking of the privileged NP on the verb in Ayeri has no effect on grammatical relations; making a transitive verb agree with an NP

- (168) a. *Surpreng*, [CP *le koronye* *ang Pila guratan* ].

 look-3SG.F A=Apitu A=Maran sell-PTCP soap-P.INAN  
 S S/A T R

Intended: ‘Apitu appears to have been sold the soap by Maran.’

other than the agent NP was also judged questionable. Thus, we would expect Ayeri to not allow for the same flexibility as Tagalog. The next two sets of example sentences, (168) and (169), thus feature non-actor topics in the complement clause in the (a) examples which we attempt to raise into the subject position of the matrix clause in the (b) examples.

Comparing (168) and (169) with (167a) and (167b), it becomes apparent that Ayeri is very dissimilar to Tagalog with regards to the promotion of a non-actor NP to the subject of the matrix clause in that it is not possible to produce a grammatical result this way. Besides yet more evidence for the disconnect between the marking on the verb and subject assignment and also evidence in favor of an interpretation of the actor NP as the subject, it is possibly the fact that the subordinate verb appears

in a non-finite form when raising occurs that prevents some of the flexibility of Tagalog observed above. Even if Ayeri were to work like Tagalog large and by, since finiteness in Ayeri also includes topic marking, it would not be possible for the non-finite verb to mark the assignment of grammatical roles to its complements, overt or covert.

The examples (163) and (164) from Tagalog quoted initially both feature to-object raising: the subject of the complement clause becomes an object of the matrix clause's verb. This phenomenon is also known as *exceptional case marking* (ECM) or *accusative and infinitive* (ACI) and entails that the matrix verb assigns accusative/objective case to the raised subject (Carnie 2013: 439–442, 445, 451). The raised subject is not semantically an object of the matrix verb, however, but an external agent:

- (170) a. *Mother wants them to study tonight* ≠ *Mother wants them*  
 b. *Mary expects him to tidy the room* ≠ *Mary expects him*  
 c. *John hears people sing in the street* ≠ *John hears people*

Ayeri avoids this kind of construction. The reason for this is probably that even though it treats agent and patient as semantic metaroles rather permissively, case marking is nonetheless based on semantic roles rather than purely based on syntactic function. Due to the uniqueness condition, a verb in Ayeri cannot have two agent arguments, yet the raised object is an agent, albeit an external one. It is still salient enough as an agent to preclude assigning it patient case, though.

- (171) a. *Galamye ang Sipra, ang sibunja Ijān sangalas.*  
 galam-ye ang=Sipra ang=sibund-ya Ø= Ijān sangal-as  
 expect-3SG.F A= Sipra AT= tidy-3SG.M TOP=Ijān room-P  
 'Sipra expects that Ijān tidy up the room.'
- b. \**Ang galamye Sipra ang/sa Ijān sibunjam sangalas.*  
 ang=galam-ye Ø= Sipra ang=/sa=Ijān sibund-yam sangal-as  
 AT= expect-3SG.F TOP=Sipra A/P= Ijān tidy-PTCP room-P  
 Intended: 'Sipra expects Ijān to tidy up the room.'
- c. \**Ang galamye sibunjam Sipra sa Ijān sangalas.*  
 ang=galam-ye sibund-yam Ø= Sipra sa=Ijān sangal-as  
 AT= expect-3SG.F tidy-PTCP TOP=Sipra P= Ijān room-P  
 Intended: 'Sipra expects Ijān to tidy up the room.'

The example sentences in (171) show that to-object raising is not possible with verbs of wanting—here using *galam-* 'expect' by way of example. That is, the subject of the complement clause in (171a), *Ijān*, cannot take the object position of the matrix clause in (171b), nor is it possible to form a complex predicate with

the arguments of the subordinate verb,  $\text{ḥḥḥḥ}$  *sibund-* ‘tidy’, becoming arguments of the matrix clause’s verb,  $\text{ḡḡḡḡ}$  *galam-* ‘expect’, in the way of (166) in (171c).

Other verbs which allow to-object raising in English include verbs of wanting like *need* or *want*, or verbs of perception like *see* or *hear*. English also permits this construction for verbs of cognition like *believe*, *consider*, *know*, and *think*, and for verbs expressing a causative relationship like *make* or *let*. As described in section 4.1.3 (p. 121), verbs like *make* or *let* do not have direct counterparts in Ayeri, as Ayeri uses a morphosyntactic strategy rather than a lexical one to express causative relationships. However, as (172) shows, Ayeri does not allow to-object raising with verbs of perception and verbs of cognition either.

- (172) a. \**Ang tangya                      Yan keynamas   malyyam   kirinya.*  
           ang=tang-ya    Ø= Yan   keynam-as   maly-yam   kirin-ya  
           A=   hear-3SG.M   TOP=Yan   people-P   sing-PTCP   street-LOC  
           ‘Yan hears people sing in the street.’  
       b. \**Paronyeng            sa   Avan   tesayam.*  
           paron=yeng    sa=Avan   tesa-yam  
           believe=3SG.F.A   P=   Avan   lie-PTCP  
           ‘She believes Avan to lie.’

### Control

Control verbs behave basically in the opposite way of raising verbs: the subject of the subordinate verb is also an argument of the verb in the matrix clause—subject or object—and this argument acts as a controller for the subject of the subordinate verb. The main clause predicate thus is thought to assign two thematic roles. In GG it is assumed that the subject of the lower clause is a silent PRO element which is coindexed with the controller (Carnie 2013: 442–445, 451).

- (173) a. Subject control:  
           *John<sub>i</sub> tries [that John<sub>i</sub> gets a job]*  
           = *John<sub>i</sub> tries [PRO<sub>i</sub> to t<sub>PRO</sub> get a job]*  
       b. Object control:  
           *The officer ordered Mary<sub>i</sub> [that Mary<sub>i</sub> turn back]*  
           = *The officer ordered Mary<sub>i</sub> [PRO<sub>i</sub> to t<sub>PRO</sub> turn back]*

Kroeger (1991) refers to subject control as ‘Equi’ and reports that according to Schachter (1976: 505), it is typically the actor of the subordinate verb that is the target of deletion. At first sight this would be a strong argument in favor of defining the actor NP as the subject, however, he notes that under certain circumstances,

- [illegible]

[illegible][illegible]

'He planned to give Mother (some/the) money.'

While the nominative argument of the subordinate verb changes between the actor in (174a), the theme in (174b), and the recipient in (174c), it is always the actor which is dropped as the coreferential argument. Why the example sentences in (174) use *balak* 'plan, intend' in its object-voice form is not explained. However, Kroeger (1991) mentions that "alternation in the voice category of the matrix verb and the case marking of the controller does not affect the control relation" (37). In other words: whether the actor in the matrix clause is the subject or not does not matter; for Tagalog's equivalent of subject-control verbs the control relationship always finds its origin in the actor argument, although there are a few exceptions, as mentioned above. The set in (175) presents an interesting example of ('obligatory') control based on the patient/theme argument in Tagalog's equivalent of object-control verbs.

(175) Tagalog (adapted from Kroeger 1991: 93–94):

‘I ordered Maria to kiss Pedro.’

‘I ordered Maria to be kissed by Pedro.’

‘I ordered Maria (to allow herself) to be kissed by Pedro.’

Regarding (175ab), Kroeger (1991) explains that “when the complement verb appears in its volitive (unmarked) form, the controllee must be the Actor of the embedded clause” (93). Thus, *Maria* cannot be the patient subject in (175b), since she is still the controllee. If the verb of the embedded clause is marked for non-volitive mood as in (175c), however, the sentence becomes grammatical: “When the embedded verb is marked for non-volitive mood, the pattern is reversed: the controllee must be the subject, and not the Actor. Actor gaps cannot be controlled in non-volitive complements” (94). The difference between obligatory and non-obligatory control adds a further complication to acceptability, but these details do not need to preoccupy us for the purpose of comparison to Ayeri, which lacks these distinctions.

As previously with raising verbs, it is possible in Ayeri to combine a subordinating verb with a full complement clause (176a), an embedded IP complement (176b), or complete incorporation (176c). In both (176a) and (176b) cases, it is necessarily the actor which is coreferenced, as the bottom arrow shows. In (176c), the bottom arrow does not show coreference, but the relation of verb agreement. The arrow on top, as before, shows what the respective verb picks as the clause’s topic for all example sentences.

- (176) a. *Linkaya ang Maran, [CP ang kondisaya agujas.].*  
 linka-ya ang=Maran ang=kondisa=ya.Ø agu-ye-as  
 try-3SG.M A=Maran AT=feed=3SG.M.TOP chicken-PL-P  
 S S/A P  
 Literally: 'Maran tried that he feeds the chicken.'
- b. *Linkaya ang Maran [S kondisayam agujas].*  
 linka-ya ang=Maran kondisa-yam agu-ye-as  
 try-3SG.M A=Maran feed-PTCP chicken-PL-P  
 S S/A P  
 'Maran tried to feed the chicken.'
- c. *Ang linkaya kondisayam Maran agujas.*  
 ang=linka-ya kondisa-yam Ø=Maran agu-ye-as  
 AT=try-3SG.M feed-PTCP TOP=Maran chicken-PL-P  
 S/A P  
 'Maran, he tried feeding the chicken.'

As with raising verbs, the embedded and incorporated verbs appear in a non-finite form, the participle. For (176b) the reason may be that there is no overt agent in the clause with which to agree, and agreement with the patient does not make sense here because the clause does not express a passive either. In (176c) the reason may be that the main verb already carries person features. If the topic marking on the finite verb is altered as in (177), the meaning of the sentences does not change with regards to grammatical relations and voice, giving us yet more reason to assume that the agent is the grammatical subject, and that topic marking has no influence on these matters. Ayeri thus has actual subject-control verbs in the way English has them.

In object-control constructions, the object of the matrix clause's verb is an actual argument of it, as shown in (178). This argument becomes the subject of the embedded clause, and there is no change in the meaning of the verb between both versions of sentences. We have seen above that Ayeri does not allow to-object raising, since it is not possible to assign patient case to an external agent because Ayeri's case marking is not purely based on grammatical functions, but there is still also some semantic motivation. Ayeri does, however, allow object control, so it seems to be possible at least to implicitly convert the matrix clause's patient or theme to the agent of the embedded clause, while the opposite is apparently not

- (177) a. *Linkaya ang Maran, [CP le kondisayāng aguye. ]*.  
 linka-ya ang=Maran le=kondisa=yāng agu-ye-Ø
- try-3SG.M A=Maran PT=feed=3SG.M.A chicken-PL-TOP

- 

possible. Whether syntactic precedence or some kind of accessibility hierarchy is involved here still needs to be investigated.

- (178) a. *John asked [Mary to give Peter the book]*  
 = *John asked Mary*
- b. *The teacher instructs [the students to calculate parables]*  
 = *The teacher instructs the students*
- c. *I persuaded [my friend to come along]*  
 = *I persuaded my friend*

The example sentences in (179) follow the format of those above. Again, it is generally possible to use a complement clause as in (179a) or (179b), as well as complementing the verb in the matrix clause with a non-finite clause with object control (179c). However, the incorporation strategy is not possible here because this would cause a doubling of case roles (179d). As we will see below, however, this is not an issue for intransitive complement clauses.

Strictly speaking, it does not matter in (179a) and (179b) whether the coreferenced argument is the topic in both clauses or not; it is simply not unlikely that it is. Again, topicalization does not have an effect on grammatical relations—although it was shown above that Tagalog, in the canonical case, deviates from its normal behavior as well with regards to control verbs to the point where this construction has been used as an argument in favor of the actor argument being the subject. As for Ayeri, unlike in coordinated main clauses, topicalization is not a strategy for disambiguation of several possible controllers for the pronominal agent of the complement/embedded clause here. Due to the semantics of the verb in the matrix clause, it is clear that the patient argument is to be understood as the agent

- (179) a. *Pinyaya ang Amān, [CP ang rimaya Kagan kunangley ].*

 PT=ask-3SG.M A=Amān TOP=Kagan close-PTCP door-P.INAN  
 S/A P S/A P  
 ‘Kagan, Amān asks him to close the door.’
- d. \**Sa pinyaya [s rimayam ] ang Amān Kagan kunangley.*  
 sa=pinya-ya rima-yam ang=Amān Ø=Kagan kunang-ley  
 PT=ask-3SG.M close-PTCP A=Amān TOP=Kagan door-P.INAN  
 S/A P S/A P P  
 Literally: ‘Kagan<sub>i</sub>, Amān asks closing him<sub>i</sub> the door.’

of the subordinate verb. Thus, there is no ambiguity in anaphoric reference in the complement clause.

As mentioned above, forming a complex predicate and extraposing the arguments of the embedded verb in (179d) is problematic due to the doubling of case roles. However, the ‘intermediate’ strategy of adjoining the S of the complement clause, containing all its arguments, to the IP of the matrix clause, as shown in (180), is equally unfavorable. A whole clause would end up center-embedded between the matrix verb and its core arguments this way, which becomes the more awkward the longer clause is. It is possible, however, to use the S adjunction strategy with intransitive complement clauses, as illustrated by (181), since there are no objects in the embedded VP to become problematic.

*Literally:* ‘Kagan, Amān asks to close the door him.’

‘Amān, he orders Pada to run.’

‘Pada, Amān orders her to run.’

### Conclusion

Now that a few tests were conducted, let us collect the results. As Table 5.3 shows, Tagalog and Ayeri are not really similar in that Tagalog consistently prefers what Kroeger (1991) analyzes as the nominative argument for all the listed constructions. The nominative argument is also independent from the actor, so that the logical subject is not necessarily the syntactic subject. Essentially, what Tagalog does, is

to generalize voice marking beyond passive voice, so that any argument of the verb can be the subject without suppressing higher-ranking roles or demoting them to adverbials.

Ayeri, on the other hand, very much prefers the actor argument (called *agent* here for consistency with other materials on Ayeri published online) for traits usually associated with subjects, independent of whether the agent is also the topic of the clause. In spite of a few irregularities like patient agreement in agentless clauses and using topicalization as a way to disambiguate the syntactic pivot in ambiguous cases, Ayeri is remarkably consistent with a NOM-ACC language. The fact that there is a subject is also evidence for the hypothesis that Ayeri is configurational. Since it clearly prefers agent NPs over other NPs, not all arguments of a verb are on equal footing. Tagalog, on the other hand, treats the arguments of verbs in a much more equal manner.

It was pointed out before that in Tagalog, the syntactic pivot depends on what is marked as a subject (Kroeger 1991: 30–31). This and other examples from Kroeger (1991) may make it seem like Tagalog is not fixed with regards to the distinction between NOM-ACC and ERG-ABS alignment. However, Kroeger (1991) also points out that there is a statistically significant preference to select patient arguments as subjects, and that OV forms of verbs are “morphologically more ‘basic’” (53) than their respective AV counterparts. These observations point towards an interpretation of Tagalog being syntactically ergative, though Kroeger (1991) deems such an interpretation problematic due to non-nominative agents keeping their status as an argument of the verb—which also distinguishes Tagalog from an ergative languages like Dyirbal, where “ergative (or instrumental) marked agents are relatively inert, playing almost no role in the syntax, and have been analyzed as oblique arguments” (54).

#### 5.4.5 Establishing configurationality

As mentioned above, Ayeri’s unmarked word order is VSO, and unlike Tagalog, it mostly displays correlations between the agent and syntactic traits usually associated with subjects. I will assume, therefore, that the agent argument is in fact the syntactic subject for all intents and purposes. It was also pointed out above that not grouping V and O together does not automatically result in non-configurationality at the sentence level. Speas (1990: 128) also points out that free word order alone is not sufficient evidence to claim non-configurationality. While Ayeri marks case overtly on all NPs and NPs have a certain degree of freedom with regards to their ordering, it does not mean that any order is always acceptable, much like *\*the yellow American big school bus* is not acceptable in English even though all adjectives equally describe *school bus* with no apparent ranking implied.

Table 5.3: Comparison between Tagalog (Kroeger 1991) and Ayeri

Criterion	Tagalog	Ayeri
<b>Verb agreement</b>	optional; if present with NOM, independent of being A	required; typically with A, independent of being TOP
<b>Syntactic pivot</b>	determined by NOM, independent of being A	usually with A, but determined by TOP in ambiguous cases
<b>Quantifier float</b>	referring to NOM, independent of being A	referring to A, independent of being TOP
<b>Relativization</b>	only of NOM, independent of being A	(all NPs may be relativized)
<b>Control of secondary predicates</b>	referring to NOM, independent of being A	referring to A or P depending on semantics, but independent of being TOP
<b>Raising</b>	usually of NOM; A possible but marked for some	only of A, independent of being TOP; no ECM
<b>Control</b>	A deletion target, independent of being NOM (with exceptions)	A deletion target, independent of being TOP

In his discussion of the status of Tagalog with regards to configurationality, Kroeger (1991) refers to a number of criteria devised in Speas (1990), who investigates the effects (non-)configurationality has on the relation between subject and object from a structural perspective. I have implicitly assumed so far that Ayeri is configurational with regards to the verb and its arguments, however, I will apply the mentioned criteria at this point in order to test whether Ayeri indeed has a ‘deep’ or a ‘flat’ structure. This will extend the insight that Ayeri makes a functional difference between subject and object gained by the various tests in section 5.4.4. Tests on configurationality which cannot be applied to Ayeri are those concerning the weak crossover effect, since Ayeri’s question words are *in situ*, and noun incorporation, since Ayeri does not have noun incorporation.

*V + O as a surface constituent*

Even though Ayeri does not group V and O together the way English does, it might still be interesting to see what happens if we try to delete or pronominalize them. In English it is possible for V and O to move together (as VP), as well as to replace V' with 'so' or 'did (so)':

- (182) a. *She said she would read the book, and read the book she did.*  
 b. *Mary read the book, and so did John.*  
 c. *Anne didn't read the book, but Tom did \_\_\_\_.*

Since Ayeri is very strict about the placement of the verb and does not share English's strategy to emphasize a verb with the equivalent of *do*, it is not possible to reproduce (182a),<sup>26</sup> but it is possible to reproduce (182bc):

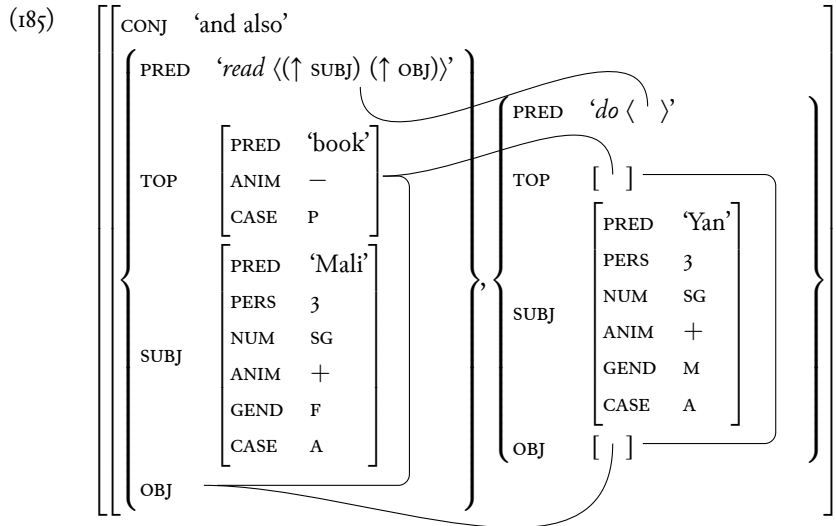

- (183) a. *Sa layaye ang Mali koya, naynay da-miraya ang Yan.*  
 sa laya-ye ang=Mali koya-Ø naynay da=mira-ya ang=Yan  
 PT read-3SG.F A= Mali book-TOP and.also so=do-3SG.M A= Yan  
 'The book, Mali read it, and Yan did so as well.'
- b. *Sa layoyye ang Anang koya, nārya māy da-miraya ang Tang.*  
 sa laya-oy-ye ang=Anang koya-Ø nārya māy da=mira-ya ang=Tang  
 PT read-NEG-3SG.F A= Anang book-TOP but AFF so=do-3SG.M A= Tang  
 'Anang didn't read the book, but Tang did so.'

Even though the verb and the object are not adjacent, it appears that together they can be replaced by *da-miraya* '(he) did so'. In GG it would probably be assumed that the sentences in (183) actually have *layaye koyās* '(she) reads the book' underlying, though it should also be possible to analyze this in terms of f-structure. Ayeri also allows to drop the repeated part completely, as (184) shows.

- (184) *Sa layaye ang Mali koya, naynay ang Yan.*  
 sa laya-ye ang=Mali koya-Ø naynay ang=Yan  
 PT read-3SG.F A= Mali book-TOP and.also A= Yan  
 'The book, Mali read it, and Yan as well.'

The example in (185) attempts to capture the functional structure of example (183a) as representative of all three sentences in (183ab) and (184). The chart is based on the discussion of apparent V-to-I movement outlined in section 5.4.1, where I<sup>0</sup> is an extended head of VP, and thus is functionally equivalent to V<sup>0</sup>. Hence, even

<sup>26</sup> This would instead translate to *Narayeng, ang layongye koyās, nay layayeng cuyam* 'She said she would read the book, and she read (it) indeed' in Ayeri.

though V and O are not directly adjacent in Ayeri, the pro-verb *mirā* ‘do’ may still stand in for the first conjunct’s verb, and the argument structure of the first conjunct’s verb as well as its object are copied to the second conjunct, with the object/topic of the first conjunct being dropped in order to avoid repetition. Replacement by a pro-form and dropping are thus not good measures to establish Ayeri’s surface constituent structure with regards to VP.

However, we can exclude that the subject NP and V/I group together in that sentences where *mirā* ‘do’ is supposed to replace the subject and the verb are ungrammatical, as illustrated in (186).

- (186) \**Ang keca Mandan nikaley naynay miraya disuley.*  
 ang ket-ya Ø= Mandan nika-ley naynay mira-ya disu-ley  
 AT wash-3SG.M TOP=Mandan potato-P.INAN and.also do-3SG.M banana-P.INAN

‘Mandan, he washes the potato and as well does the banana.’

What is mostly awkward about this example is that there is a transitive sentence in the second conjunct, but no topic is marked on the verb. If an agent topic were marked as a logical continuation of the first conjunct, it would mean that the verb carries not simply the third-person agreement suffix *-ya* ‘-s’, but the topic-marked pronominal clitic *ya* ‘he’. The conjunct, then, would have a separate subject, rendering our test futile. Switching the topic to the object of each conjunct would produce an awkward result as well, though, since topic continuity can be reasonably expected in this case. The verb in the second conjunct would be obliged to carry the third-person pronominal clitic *yāng* ‘he’ and thus would again render the test futile. And while a second conjunct with *naynay disuley* ‘and also the

banana' would produce a grammatical outcome, there is no pro-verb in this clause, but the missing elements are simply supplemented by consistency with the context.

#### *Assymetric influence on thematic roles*

According to Speas (1990: 129), the semantic role of the subject is determined by the object, but not vice versa. Hence, for instance, someone who *throws a party* does not hurl it through the air, as someone who *throws a stone* would, and someone who *kills time* is not guilty of murder. This also reaches into the idiomatic use of certain verbs. Basically, this criterion suggests that in a truly non-configurational language, there ought to be cases where the role of the subject is determined by the actor. This is not the case in Ayeri, though, and a few examples (to varying degrees of idiom-ness) are:

(187) ၵၢၢၢ *taringaya* 'the minister'

- a. ၵၢၢၢ-ၵၢၢၢ *ang bengya ... sangalya* '... stands in a room'
- b. ၵၢၢၢ-ၵၢၢၢ *ang bengya ... kanānya* '... attends a wedding'
- c. ၵၢၢၢ-ၵၢၢၢ *ang bengya ... tesānley* '... admits a lie'

(188) ၵၢၢၢ *devaya* 'the captain'

- a. ၵၢၢၢ-ၵၢၢၢ *ang pabya ... telbānley* '... removes a sign'
- b. ၵၢၢၢ-ၵၢၢၢ *ang pabya ... pegamayās* '... arrests a thief'

Comparing the examples in (187) is maybe most illustrative since the various shades of meaning differ most there; the common element of the examples in (188) should be more obvious, since to 'remove' or 'take away' a person is likely simply a euphemism for their seizure by police. At least in (187), the semantic role of the subject given at the top cannot be reliably predicted from the combination of the subject and the verb alone: is the minister standing somewhere literally, is he attending an event, or admitting something? In a similar way, is the captain in (188) removing something or arresting someone? In any case, the verb and its complement form a semantic unit in Ayeri, even though they are not adjacent in main clauses of declarative statements.

#### *Idioms*

Similar to the previous point, there are no idioms involving just a verb and a subject NP, while there are idioms consisting of a set combination of a verb and a complement which is attributed to a subject as a unit, for instance:

- (189) a. *braṣ- tibangya* ‘bathe in knives’  
(be in terrible distress)
- b. *petiga- inunas sapayeri-nama* ‘catch a fish with bare hands’  
(make a futile attempt)
- c. *sic- koyayeley* ‘spit books’  
(be smartassing)
- d. *tabada- venley* ‘chew air’  
(be poor, have nothing to eat)
- e. *vibisa- hapangyeley bihanena sarisa kayanyam iri* ‘dish out last week’s remains for the third time already’  
(bring up a topic which has been discussed to death)

Just stating a subject and a verb like, for instance, *sicya ang Tapan* ‘Tapan spits’ would just be understood as that, literally. The idiomatic meaning of showing off (second-hand) knowledge in an annoying way depends on the object, *koyayeley* ‘books’.

#### Obligatoriness of subjects

While Ayeri allows for intransitive verbs like *niba-* ‘rest’ or for transitive verbs to be used intransitively like *kond-* ‘eat’, there are no verbs which require an object but do not optionally or obligatorily require a subject. While the agent of a transitive verb may be dropped, the patient argument triggers verb agreement which is canonically with the agent subject—compare example (136b) above, which is repeated here for convenience:

- (190) *Manye sa Pila.*  
man-ye Ø=Pila  
greet-3SG.F P= Pila  
‘Pila is greeted.’

Even for verbs expressing impersonal actions, like weather verbs, a dummy subject conventionally appears in the form of an inanimate third-person pronominal of some kind.

- (191) *Seyarreng.*  
seyar=reng  
rain=3SG.INAN.A  
‘It is raining.’

As we have seen above (section 5.4.4, p. 339), Ayeri has verbs like *surp-* ‘seem’, which can make a subordinate verb’s subject their own (192a). That is,

the matrix verb's semantically incongruent subject receives its semantic role from its subordinate verb. Thus, in (192a), *Apitu* is an experiencer according to the subordinate verb *vac-yam* 'liking', she is not someone who acts in a manner of seeming, as (192b) would imply. The matrix verb's subject may also be a dummy pronominal (192c). Omitting subject inflection is not grammatical (192d).

- (192) a. *Surpye ang Apitu vacyam perinas.*  
 surp-ye ang=Apitu vac-yam perin-as  
 seem-3SG.F A= Apitu like-PTCP sun-P  
 'Apitu seems to like the sun.'
- b. \**Surpye ang Apitu.*  
 surp-ye ang=Apitu  
 seem-3SG.F A= Apitu  
 'Apitu seems.'
- c. *Surpreng ang vacye Apitu perinas.*  
 surp=reng ang=vac-ye Ø= Apitu perin-as  
 seem=3SG.INAN.A AT like-3SG.F TOP=Apitu sun-P  
 'It seems that Apitu likes the sun.'
- d. \**Surpa, ang vacye Apitu perinas.*  
 surp ang=vac-ye Ø= Apitu perin-as  
 seem AT like-3SG.F TOP=Apitu sun-P  
 Literally: 'Seem that Apitu likes the sun.'

Conversely, in subject control (section 5.4.4, p. 345), where the matrix verb's subject is shared with the subject of the subordinate verb, the subordinate verb's subject cannot be a dummy pronoun (193b), and neither can the matrix verb's subject be (193c).

- (193) a. *Gabaya ang Tipal pengalyam sa Apan.*  
 gaha-ya ang=Tipal pengal-yam sa=Apan  
 hope-3SG.M A= Tipal meet-PTCP P= Apan  
 'Tipal hopes to meet Apan.'
- b. \**Gabaya ang Tipal, sa pengalreng Apan.*  
 gaha-ya ang=Tipal sa=pengal=reng Ø= Apan  
 hope-3SG.M A= Tipal PT=meet=3SG.INAN.A TOP=Apan  
 Literally: 'Tipal hopes that there will meet Apan.'
- c. \**Gabareng pengalyam sa Apan.*  
 gaha=reng pengal-yam sa=Apan  
 hope=3SG.INAN.A meet-PTCP P= Apan  
 Literally: 'There hopes to meet Apan.'

*Binding*

According to (Speas 1990), coreference of pronouns in English can be explained by the subject's being higher in a clause's structure than an object. From this, she deduces that if "some language has a 'flat' structure, then the subject and object will c-command each other, and so it is possible for the object to bind the subject" (132). The anaphor would bind the subject in sentences like the following, instead of the other way around, so that the following sentences should be grammatical or ungrammatical, respectively:

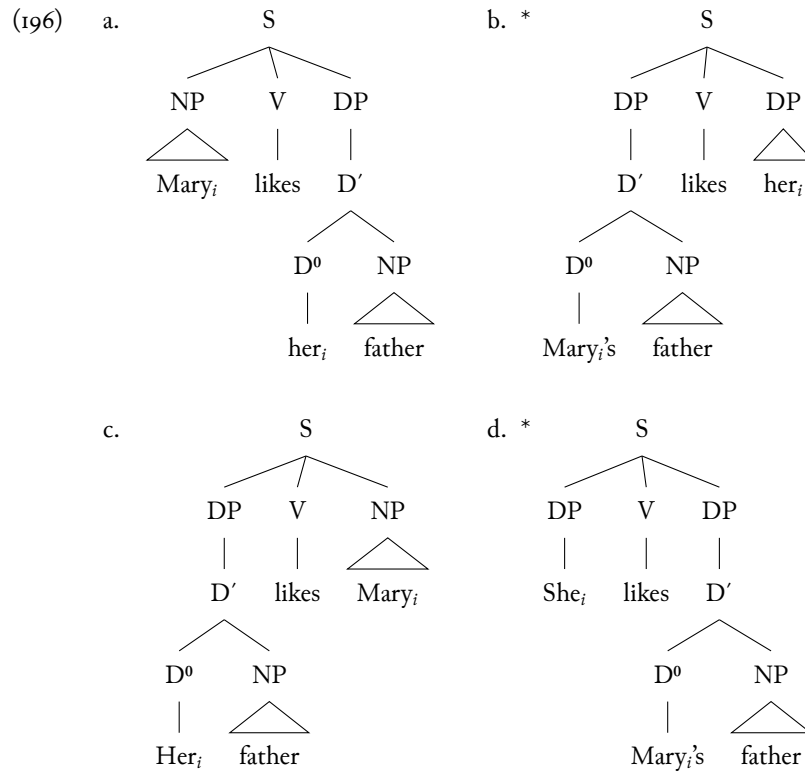

- (194) a. *Mary<sub>i</sub> likes her<sub>i</sub> father.*  
 b. \**Mary<sub>i</sub>'s father likes her<sub>i</sub>.*  
 c. *Her<sub>i</sub> father likes Mary<sub>i</sub>.*  
 d. \**She<sub>i</sub> likes Mary<sub>i</sub>'s father.*

In Government and Binding theory, there are three binding principles posited, referring to the grammaticality of coreference between reflexive pronouns ('anaphora'), personal pronouns, and R-expressions (references to extralinguistic reality, like names):

- (195) The Binding Principles (Carnie 2013: 157):
- a. An anaphor must be bound [i.e. c-commanded, CB] in its binding domain.
  - b. A pronoun must be free [i.e. not c-commanded, CB] in its binding domain.
  - c. An R-expression must be free.

According to these principles, (194a) is expected to be grammatical in a language in which the object c-commands the subject because *Mary* is not bound by the pronoun *her*, whose binding domain is *her father*, so Principle C is not violated. However, in (194b), the pronoun c-commands *Mary* and R-expressions must not be bound even across binding domains, so Principle C is violated here. Conversely again, *her* in (194c) is free in its binding domain and in a different binding domain than *Mary*, so even though *her father* is commanded by *Mary*, Principle B is not violated. Lastly, (194d) is ungrammatical again because *she* is c-commanded and thus not free. Also compare the diagrams in (196).

The examples above assume a structuralist approach, while I have so far tried to use a more flexible functional approach. LFG's approach to binding are not based in constituent structure hierarchies, but in functional and semantic structure. Binding is thus conceptualized by way of coindexing between a referent and an anaphora (Bresnan et al. 2016: 231). There is also the requirement that a referent outrank its anaphora on the functional hierarchy:

(197) Functional hierarchy (Bresnan et al. 2016: 229):

SUBJ > OBJ > OBJ<sub>θ</sub> > OBL<sub>θ</sub> > COMP > ADJ

Furthermore, reflexive pronouns are considered ‘nuclear’, that is, that it is required that they be bound in their minimal f-structure nucleus that contains the reflexive and a subject outranking it. Personal pronouns need to be free in their minimal f-structure nucleus; other nominals must be free completely (237). This is basically a rephrasing of the Binding Principles A, B, and C as quoted in (195), except that this version is based in functional structure, not in constituent structure. A minimal f-structure nucleus is the predicator of an f-structure together with the bare argument functions the a-structure of the verb specifies.

...

- How do we know S is a constituent?
- IP above S → verb in this position can't be infinite, so inflection is an obligatory condition in this position
- Do we know whether there's a “hidden” VP in S? → test for constituency

- Tests on cline between logical SUBJ NPs vs. rest → compare with Kroeger (1991: 112) (who cites Speas 1990: 137 for criteria, cf. Speas (1990: 123–201) for whole chapter)

## B Example Texts

## B.1 The North Wind and the Sun

(From Becker 2016c)

The North Wind and the Sun were disputing which was the stronger, when a traveller came along wrapped in a warm cloak. They agreed that the one who first succeeded in making the traveller take his cloak off should be considered stronger than the other. Then the North Wind blew as hard as he could, but the more he blew the more closely did the traveller fold his cloak around him; and at last the North Wind gave up the attempt. Then the Sun shone out warmly, and immediately the traveller took off his cloak. And so the North Wind was obliged to confess that the Sun was the stronger of the two. (After Aesop; International Phonetic Association 2007: 39)

## B.2 The Fox and the Rooster

(Adapted from Becker 2016b)

Once upon a time, a hungry fox came to a village. He said to the rooster: “Let me hear your beautiful voice!” The proud rooster closed his eyes and crowed loudly. There the fox grabbed him and carried him into the forest. When the farmers noticed this, they ran after the fox and cried “The fox is carrying away our rooster!” There the rooster said to the fox: “Tell them, ‘I am carrying my rooster and not yours!’” The fox released the rooster from his mouth and called “I am carrying my rooster and not yours!” There, however, the rooster quickly flew onto a tree. The fox called himself a fool and trotted off. (After Aesop)

## B.3 Ozymandias

(Adapted from Becker 2011b)

### Ozymandias

I met a traveller from an antique land,  
 Who said – “two vast and trunkless legs of stone  
 Stand in the desert ... near them, on the sand,  
 Half sunk a shattered visage lies, whose frown,  
 And wrinkled lips, and sneer of cold command,  
 Tell that its sculptor well those passions read  
 Which yet survive, stamped on these lifeless things,  
 The hand that mocked them, and the heart that fed;  
 And on the pedestal these words appear:

<sup>1</sup> This sentence was translated rather literally from the German *der Fuchs schalt sich einen Narren*, literally ‘the fox scolded himself a fool’, with *einen Narren* ‘a fool’ as an object-predicative nominal.

(Shelley 2003)

[illegible]

*Sa pengalyang asano similena tado, ang naraya: Namāng sam kāryo nay taryankay bengyon adābalya. Ya hemayong kiyisa nasay adany', abalya, marinas avanu-ngas. ---

- adjectives, 167–170
- adpositions, 77, 170–179
  - of time, 178–179
- adverbs, 214–223
  - attributive, 214–216
  - degree and quantity, 217–218
  - demonstrative adverbs, 222–223
  - sentence adverbs, 219–222
- agglutination, 63
- agreement
  - number, 180–192
  - person, 180–192
- allomorphy, 193, 195, 204
- allophony
  - of consonants, 7–10, 40
  - of vowels, 10–12, 19
- aspect, 198–200
  - habitual, 200
  - iterative, 201–202
  - progressive, 72, 73, 199–200
- Box script, 45
- Brāhmī scripts, 45
- cases, 75, 113–125
  - agent, 114–115
  - causative, 121–122
  - dative, 9, 117–118
  - genitive, 102, 119–120
  - instrumental, 122–124
  - locative, 120–121
  - patient, 115–117
- clitics, 64, 71–102
- comparison
  - of adjectives, 168
  - of adverbs, 215
- complement clause, 42
- compounds, 38–40, 127–137
  - coordinative, 135
  - endocentric, 129–133
  - exocentric, 136
  - synthetic, 133–134
- conjunctions, 233–237
  - kamo ... nay*, 235–236
  - kamo ... soyang*, 236–237
  - nay*, 234
  - soyang*, 234–235
- consonants, 7–10, 16, 19, 20, 22–24, 26, 28, 47–48
  - clusters, 16, 23, 30–31
- dependent marking, 102
- diacritics, 50–56
- diminutive, 70
- diphthongs, 10, 19, 33, 52
- discourse particles, 72
- gender, 107–110
- gerund, 141–144
- goals, 3, 4

- marking strategies, 102
