Set in Junicode and Fira Sans with Xe<sub>La</sub>TeX.

Ayeri is a fictional language spoken by fictional people in a fictional setting, and as such is not related to any naturally existing languages. It is thus not to be confused with *Azeri*, a Turkic language spoken in Azerbaijan and its surrounding countries. Ayeri's vocabulary is entirely a priori, this means, no real-world languages have been used specifically as sources of vocabulary. Due to the language's sound and spelling aesthetic being inspired by Austronesian languages, it is not surprising if overlaps with existing words in those languages happen accidentally.

# Preface

---

This is my latest attempt to write a grammar of Ayeri, a fictional language which I have been developing since December 2003. Getting to work on grammar writing again was triggered by a growing dissatisfaction with not having a central place of documentation, when the first thing people look for on my website is often the grammar, incomplete as well as partially inaccurate and outdated as it may be. In addition to that, there was a seminar on fictional languages at the University of Tübingen, Germany, in the summer semester of 2016 (Buch 2016). Ayeri was one of the languages that was chosen for students to explore and evaluate.

The student group who worked on Ayeri came to the conclusion that its documentation is severely lacking in the description of basic elements and assumptions, since whole chapters of the grammar had been missing to date (Boga et al. 2016: 12).<sup>1</sup> This is to say that previous attempts of writing a full-fledged grammar of Ayeri have been incomplete due to creeping neglect.

Although the *Ayeri Grammar* has so far been lying dormant for five years, I have written a whole number of blog articles detailing various grammatical issues (Becker 2016: Blog). These articles have been taken into consideration here. This grammar writing attempt is thus not only a transferral to a different typesetting system, but constitutes an extension to previous formal documentation as well.

I hope that by transferring my previous grammar writing from LibreOffice to L<sup>A</sup>T<sub>E</sub>X, combined with using GitHub as a version control system, maintaining and editing will become faster, more transparent, and more elegant, since L<sup>A</sup>T<sub>E</sub>X operates on plain text files, and version control helps in keeping track of changes over time.

Carsten Becker  
Marburg, July 4, 2016

<sup>1</sup>  *Kutānas-ikan* ‘thanks a lot’ to Bella Boga, Madita Breuninger, Thora Daneyko, and Martina Stama-Kirr for their hard work on making sense of my published materials in spite of information being scattered all over the place, as well as their providing me with the presentation concluding their group work.

## o Introduction

---

In December 2003, the idea for a new fictional language was born, an idea that turned out to stick with me for over 10 years now.<sup>1</sup> At that time, my seventeen years old self was still fairly new to this whole making-up languages business, read things about linguistics here and there, and was not shy to ask questions about terminology (and, looking at old mails, a little impertinently teenager-like so), for example on *Conlang-L* and the *Zompist Bulletin Board*. One thing seemed to catch my interest especially: syntactic alignments other than the NOM/ACC of the few languages I was familiar with, that is, German, English, and French. Apparently this curiosity was big enough for me to grow bored with my second fictional language, Daléian (declared ‘quite complete’ after maybe half a year of work or so), and to start something new from scratch in order to put newly acquired knowledge to test.

I had read about ‘trigger languages’ on *Conlang-L* and wanted to try my hands on making my own. I cannot remember how long it took me to come up with a first draft of an Ayeri grammar, however, I do remember having been told that a good language cannot be made in a summer. Of course, I still did not really know what I was doing then, even though I thought I had understood things and authoritatively declared “this is how it works” in my first grammar draft when things sometimes really do not work that way. But at least an interest had been whetted.

In order to illustrate the various stages from the beginnings to current Ayeri, I went through some old backups contemporary with the very early days. Here is a sentence from the oldest existing document related to it, titled “Draft of & Ideas for my 3rd Conlang”—the file’s last-changed date is December 14, 2003, though I remember having started work on Ayeri in early December. I added glossing for convenience and according to what I could reconstruct from the notes. This uses vocabulary and grammatical markers just made up on the spot and for illustrative purposes; little of it actually managed to make it into actual work on Ayeri:

<sup>1</sup> A lot of the text here is taken from the blog article, “Happy 10th Anniversary, Ayeri!” (Becker 2013).

- (1) *Ayevhoi agiaemaesim coyaielieðamavir vhaieloyaŋaiye.*  
 Ay-evhoi agia-ema-esim coyai-el-i-eðam-avir vhai-el-o-yaŋa-iyē  
 3SG.AN-SBJ read-VB-SBJ.AN book-NN-AN-INDF-P bed-NN-INAN-ON-LOC  
 ‘He reads a book on the bed.’

According to the grammar draft of September 5, 2004, this would have already changed to:

- (2) *Ang layaiyāin mecoyalei ling \*pinamea.*  
 Ang laya-iy-a-in me-coya-lei ling \*pinam-ea  
 A.SBJ read-3SG.AN<sub>1</sub>-a<sub>1</sub>-SBJ INDF.INAN-book-P.INAN top.of bed-LOC  
 ‘He reads a book on the bed.’

A word for ‘bed’—*pinam*—was only (re-)introduced on October 24, 2008. In the current state of Ayeri, I would translate the sentence as follows:

- (3) *Ang layaya koyaley ling pinamya.*  
 Ang laya=ya.Ø koya-ley ling pinam-ya  
 AT read=3SG.M.TOP book-P.INAN top.of bed-LOC  
 ‘He reads a book on a/the bed.’

As you can see, quite a bit of morphology got lost already early on, especially the overt part-of-speech marking (!) and animacy marking on nouns. Also, prepositions were just incorporated into a noun complex as suffixes apparently. Gender was originally only divided into animate and inanimate, but I changed that at some point because only being familiar really with European languages, it felt awkward to me not to be able to explicitly distinguish ‘he’, ‘she’, and ‘it’.

A feature that also got lost is the assignment of thematic vowels in personal pronouns to 3rd-person referents: originally, every 3rd-person referent newly introduced into discourse would be assigned one of /a e i o u/ to disambiguate, and there was even a morpheme to mark that the speaker wanted to dissolve the association. Constituent order was theoretically variable at first, but I preferred SVO/AVP due to familiarity with that. Later on, however, I settled on VSO/VAP. Also, I had no idea about what was called “trigger morphology” on *Conlang-L* for the longest time—essentially, this referred to the Austronesian, or Philippine, alignment. I am not claiming that I know all about it now, just that due to reading up on the topic, I have a slightly more informed understanding now. Orthography changed as well over the years, so ⟨c⟩ in the early examples encodes the /k/ sound, not /tʃ/ as it does today; diphthongs are spelled as ⟨Vi⟩ instead of modern ⟨Vy⟩.

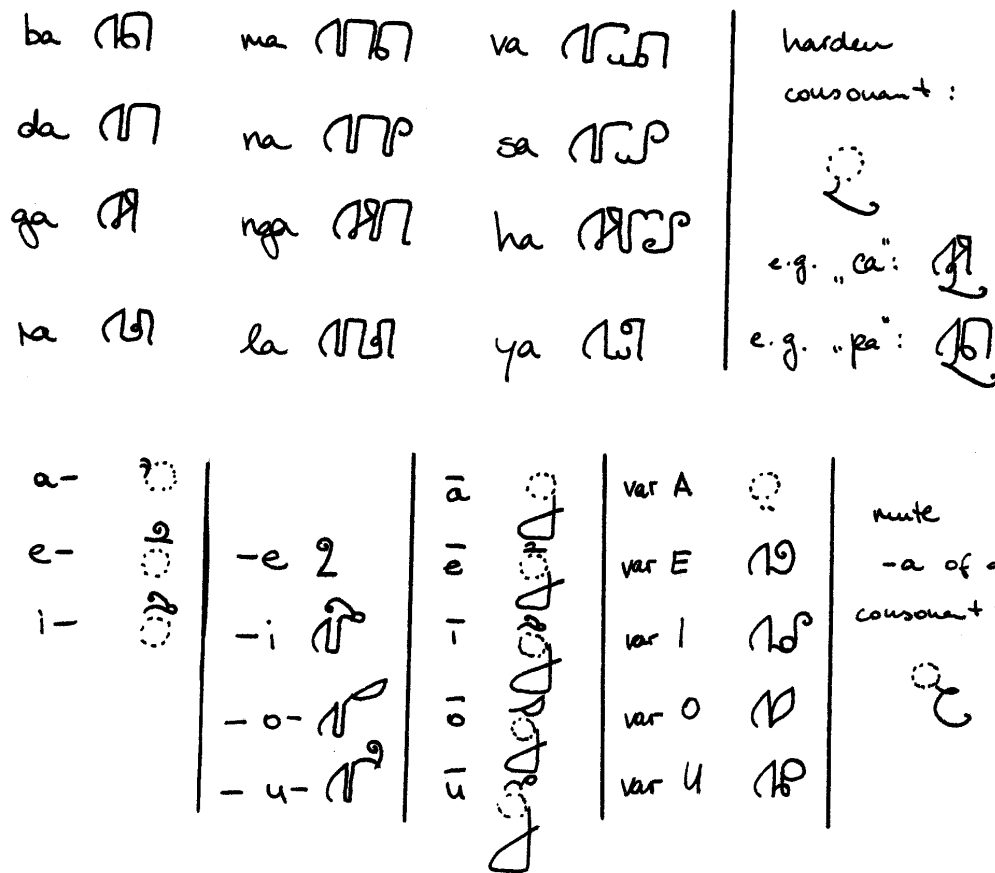

Figure 0.1: First design for an Ayeri script (February 9, 2004)

What was definitely beneficial for the development of Ayeri was the ever increasing amount of linguistics materials available online and my entering university (to study literature) in 2009, where I learned how to do research and also had a lot of interesting books available at the library.

One of the things people regularly compliment me on is Ayeri's script—note, however, that Tahano Hikamu was not the first one I came up with for Ayeri. Apparently, I had already been fascinated with the look of Javanese/Balinese writing early on; Figure 0.1 shows a draft dated February 9, 2004. However, since the letter shapes in this draft looked so confusingly alike that I could never memorize them. About a year later, I came up with the draft in Figure 0.2. What is titled “Another Experimental Script” here is what would later turn into Tahano Hikamu, Ayeri's ‘native’ script. According to the notes in my fictional language ring binder, the script looked much the same as today about a year from then, but things have only been mostly stable since about 2008.

Another important date in the history of Ayeri is when I decided to set up an improved website for Ayeri that would include a blog. The idea was that this way, I could more freely write on whatever detail I currently worked on in Ayeri, outside of the constraints of the grammar. Thus, *Benung. The Ayeri Language Resource* launched on March 1, 2011. Being able to write short articles, however, probably also led to neglecting work on the actual formal reference grammar, which had been lying dormant from January 2011 on. This was always on the premise that I would eventually include the information from blog articles in the grammar. However, juggling such a big document had always felt daunting, so I let laziness take the better part of me eventually.<sup>2</sup> This renewed attempt at documentation has been started with the intention to right those wrongs.

<sup>2</sup> Let me add to my defense, however, that I also worked on my B.A. thesis in 2013 and my M.A. thesis in 2016, which required several months of preparation each and thus left me largely unable to work much on Ayeri.

# 1 Phoneme Inventory and Phonotactics

---

This chapter will present charts depicting the phoneme inventory of Ayeri, give an analysis of the phonotactics of Ayeri's dictionary entries and also describe stress patterns.

## 1.1 Phoneme Inventory

### Consonants

At 17 consonants, Ayeri has a fairly mid-sized inventory. Table 1.1 shows the full chart. The sound /w/ only occurs marginally in ᐃᐱᐱᐱ *huākaya* ['wa:kaja] 'frog'. Other instances of it are allophones of /u/ followed by a vowel, for instance in ᐱᐱᐱ *rua-* /rwa/ 'have to, must'. /w/ may also be an allophone of /uj/, as in ᐱᐱᐱ *adauyi* [a'dawi] 'then', ᐱᐱᐱ *edaui* [e'dawi] 'now', or ᐱᐱᐱ *nekuyi* ['nekwi] 'eyebrows'. The negative suffix ᐱᐱ *-oy* is also commonly contracted to [w] before a diphthong:

- (4) ᐱᐱᐱᐱ *mingoyay* → *minguay* [mɪŋ'wai] 'I cannot' (can-NEG-1SG)

Moreover, the affricates /tʃ/ and /dʒ/ are usually allophones of /tj kj/ and /dj gj/, respectively, except if a homorganic nasal /n/ or /ŋ/ is preceding: for instance, ᐱᐱᐱ *ankyū* /'aŋ.kju/ 'really' is realized as ['aŋ.kju], not as \*['aŋ.tʃu]. The plural marker ᐱᐱ *-ye* is also commonly contracted to [dʒ] when a case suffix beginning with a vowel follows:

- (5) a. ᐱᐱᐱᐱᐱ *nyānyēang* → *nyānjang* ['nja:ndʒaŋ] 'persons' (person-PL-A)  
b. ᐱᐱᐱᐱ *netuyēas* → *netujas* [ne'tudʒas] 'brothers' (brother-PL-P)

The plural marker also may contract before the locative marker ᐱᐱ *-ya*, basically for dissimilation:<sup>1</sup>

<sup>1</sup> ᐱᐱ *-ea* also occurs as an variant morpheme, so that ᐱᐱ *-ye* + ᐱᐱ *-ea* → ᐱᐱ *-yēa*.

Table 1.1: Consonant inventory (divergent orthography in pointed brackets)

	Bilabials	Labiodentals	Alveolars	Palatals	Velars	Glottals
Plosives	p      b		t      d		k      g	
Affricates			tʃ ⟨c⟩      dʒ ⟨j⟩			
Nasals		m		n	ŋ ⟨ng⟩	
Fricatives			v      s			h
Taps/Flaps				r		
Approximants		(w)		l      j ⟨y⟩		

- (6) ၵ်းယု *nivayeya* → *nivajya* [ni'vadʒja] ‘at the eyes’ (eye-PL-LOC)

Dissimilation of the sequence ယု -*yaya* is attested in Becker (2012: 12), where the relative pronoun ၵ်းယု *siyaya* appears transcribed as *siyya*:

As far as morphophonology is concerned, the relative pronoun complex *siyya* ‘in/at/on which.LOC’ is interesting in so far as it is a contraction of *\*siyaya* ‘REL-LOC-LOC’ that I introduced here [...] Since this feature does not occur in previous texts, let’s assume it’s an acceptable variant.

It is also noted there, however, that the contraction happens “only if both parts are grammatical suffixes” (12).

While vowels become long when two identical vowels come into succession, consonants do not geminate but are treated like a single consonant:

- (7) a. တာဝံ *tavvāng* [ta'va:ŋ] ‘you get’ (get=2SG.A)  
b. ငါ့အား *disyyang* [di'sjaŋ] ‘I fasten’ (fasten=1SG.A)

## Vowels

Ayeri has a very basic five-to-six-vowel system, shown in Table 1.2.

Table 1.2: Vowel inventory (divergent orthography in pointed brackets)

	Front	Center	Back
High	i, i: ⟨ī⟩		u, u: ⟨ū⟩
Mid	e, e: ⟨ē⟩	ə ⟨ə, e⟩	o, o: ⟨ō⟩
Back		a, a: ⟨ā⟩	

The lax vowels [ɪ ɛ ʊ] occur as allophones of their tense counterparts [i e o u] in closed syllables, for example:

- (8) a. မိန့် *ming* [mɪŋ] ‘can, be able’,  
b. မိန့် *enya* [ɛŋja] ‘everyone’,  
c. မိန့် *agon* [aɡɔŋ] ‘outer, foreign’, and  
d. ပါကု *pakur* [pakuɾ] ‘ill, sick’.

/ə/ is a marginal phoneme and only occurs in the tense prefixes ၵ်း *kə-* ‘NPST’, ၵ်း *mə-* ‘PST’, ၵ်း *νə-* ‘RPST’, as well as in the prefix ၵ်း *mə-* ‘some, whichever’. Otherwise, [ə] occurs as an allophone of /e/ in final unstressed position, e.g. in the word မိန့် *mine* [miɲə] ‘affair, matter, issue’.

Ayeri also possesses a number of diphthongs, these are: /aɪ a:ɪ eɪ ɔɪ uɪ au/, spelled ⟨ay⟩, ⟨āy⟩, ⟨ey⟩, ⟨oy⟩, ⟨uy⟩, ⟨au⟩. Furthermore, the vowels [i e a o u] may be long: [i: e: a: o: u:]. Long vowels are lexicalized in a few words, for example:

- (9) a.  $\text{ႬႬႬ}$  *nīsa* ‘wanted’,  $\text{ႬႬႬ}$  *pasīsa* ‘interesting’;  
 b.  $\text{ႬႬႬ}$  *arēn* ‘anyway, however’,  $\text{ႬႬႬ}$  *lēra* ‘whore’;  
 c.  $\text{ႬႬ}$  *lā* ‘tongue’,  $\text{ႬႬ}$  *yāng* ‘he’ (he.A);  
 d.  $\text{ႬႬ}$  *nōn* ‘wish’; and  
 e.  $\text{ႬႬႬ}$  *babūan* ‘barbarian’.

Otherwise, long vowels result from two same vowels next to each other, for instance:

- (10)  $\text{ႬႬ}$  *aja-* ‘play’ +  $\text{ႬႬ}$  *-an* ‘NMLZ’ →  $\text{ႬႬႬ}$  *ajān* ‘game, play’.

Morphophonologically, long vowels also occur in double-marked relative pronouns where the agreement marker for the relative clause’s head has been omitted, for instance,  $\text{ႬႬ}$  *sinā* ‘of which, about which’, as in the following example:

- (11) *Le turayāng taman sinā ang ningay*  
*Le tura-yāng taman-Ø si-Ø-na ang ning=ay.Ø*  
 PT.INAN send=3SG.M.A letter-TOP REL-PT.INAN-GEN AT tell=1SG.TOP  
*tamala vās.*  
*tamala vās*  
 yesterday 2SG.P

‘The letter which I told you about yesterday, he sent it.’

This is to disambiguate it from the plain genitive-marked relative pronoun  $\text{ႬႬ}$  *sina* ‘which.GEN’:<sup>2</sup>

- (12) *tamanang ledanena nā sina koronvāng*  
*taman-ang ledan-ena nā si-na koron-vāng*  
 letter-A friend-GEN 1SG.GEN REL-GEN know=2SG.A

‘the letter of my friend which you know’

As pointed out in (9c), the word  $\text{ႬႬ}$  *lā* ‘tongue’ ends in a long vowel, so the question is what happens when a case suffix beginning with a vowel is appended. To avoid a hiatus, a glide /j/ may be inserted, so both of these are possible:

<sup>2</sup> A variant which combines the allomorphs of the relativizer and the genitive case marker in the opposite way also exists:  $\text{ႬႬ}$  *s-* +  $\text{ႬႬ}$  *-ena* →  $\text{ႬႬ}$  *sena*.

- (13) a. *Aku*            *lāas!*  
           Aka-u        lā-as  
           swallow-IMP tongue-P  
           ‘Shut up!’
- b. *Aku lāyas!*  
      (idem)

## 1.2 Phonotactics

For the purpose of this statistical analysis, all of the available translations into Ayeri since 2008 have been used as a text corpus;<sup>3</sup> example sentences from various blog articles have also been added, as well as dictionary entries for all nouns, adjectives, adverbs, pronouns, adpositions, conjunctions, and numerals if they were not prefixes or suffixes.<sup>4</sup> Borrowings have been deleted, if they could not reasonably be words in Ayeri. Altogether, the corpus comprises 5,500 words, which is a very small figure for such a study, but there are only so many texts available unfortunately. Words may occur more than once.

Among the dictionary entries, verbs have notably been ignored, since verb stems alone do not constitute independent words—they are always inflected in some way, so that they may end in consonants or consonant clusters that independent words cannot end in. This also has repercussions on syllabification and stress, which depend on the inflection of the verb stem:

For the purpose of gathering statistics on phonemes, the words from translation texts were converted to IPA first. Fortunately, this is rather easy as Ayeri’s romanization is very straightforward. Syllable breaks have also been inserted semi-automatically.

<sup>3</sup> These texts are: A Medieval Neighborhood Dispute (2015), A Message from the Emperor (2012), Article 1 of the Universal Declaration of Human Rights (2011), The Beginning of Tolstoy’s *Anna Karenina* (2014), Conlang Christmas Card Exchange 2008/09 (2009), Conlang Holiday Card Exchange 2010/11 (2011), Conlang Relay 15 (2008), Conlang Relay 17 (2010), Conlang Relay 18 (2011), The First Two Chapters from Saint-Exupéry’s *Le Petit Prince* (2013), The Four Candles (2010), Honey Everlasting (2014), LCC4 Relay (2011), The Lord’s Prayer (2015), The North Wind and the Sun (2016), The Origin of the Wind (2009), Ozymandias (2011), Please Call Stella ... (2008), Psalm 23 (2013), The Scientific Method (2014), The Sheep and the Horses (2012), Sugar Fairies (2011), The Upside-Down Ice Skater (2009). The texts can be accessed from Becker (2016: Examples).

<sup>4</sup> This section updates and extends a previous analysis of the phonological makeup of dictionary entries (Becker 2010). The previous study had its focus on gathering frequency statistics for word generation, however, we want to know about words generally here.

Table 1.3: Syllabification of inflected verbs

Suffix	<i>ca-</i> ‘love’	<i>gum-</i> ‘work’	<i>babr-</i> ‘mumble’
- <i>ay</i> (1SG)	cáy	gu.máy	ba.bráy
- <i>va</i> (2SG)	cá.va	gúm.va	ba.brá.va
- <i>yam</i> (PTCP)	cá.yam	gúm.yam	bá.bryam

### Number of Syllables per Word

First, let us see how many syllables words commonly have (see Table 1.4). The higher the syllable count, the more likely it is for them to be compounds or inflected words.

Table 1.4: Relative frequency of words with different numbers of syllables (n = 5500)

Segment	Count	Percentage
2 syllables	2277	41.40 %
3 syllables	1393	25.33 %
1 syllable	1201	21.84 %
4 syllables	547	9.95 %
5 syllables	74	1.35 %
6 syllables	8	0.15 %

Two-syllable words make up the bulk of the sample, which is not surprising since 1,072 (55.43 %) of the dictionary subsample are bisyllabic words. Most of Ayeri’s roots are bisyllabic; unsurprisingly, most monosyllabic words are function words like the ones cited below. A few examples for each number of syllables per word:

- (14) a. ႁႏ *yeng* ‘she’ (she.A),  
 ႏႏ *le* (PT),  
 ႏႏ *rua* ‘must’;
- b. ႏႏ *datau* ‘normal’,  
 ႏႏ *mareng* ‘it suffices’ (suffice=3SG.INAN.A),  
 ႏႏ *nasay* ‘near to’;
- c. ႏႏ *avanyāng* ‘he sinks’ (sink=3SG.M.A),  
 ႏႏ *narānye* ‘words’ (word-PL),  
 ႏႏ *tovaley* ‘a cloak’ (cloak-P.INAN);

- d. နံ့ပိတ် binyanveno (corner.beautiful, a place name),  
မာဂာဆာတော့ mangasatong ‘they used to move’ (move-HAB=3PL.N.A),  
မိတာနီ mitanena ‘of the palace’ (palace-GEN);
- e. ဟာယမာနာ haruyamanas ‘beatings’ (beat-PTCP-NMLZ-P),  
ဆီရုတယီ sirutayena ‘of the night’ (night-GEN),  
ဆွန်ကရန်ကီ sungkorankihas ‘geography’ (science.map);
- f. ကယတမာယနီ kaytomayanena ‘of righteousness’ (righteous-NMLZ-GEN),  
ကုရိုနာယာယာနီ koronaryasayan ‘they used to forget’ (forget-HAB-3PL.M),  
နာဆီမာယာယာနီ nasimayajang-ben ‘all followers’ (follow-AGTZ-PL-A=all).

Table 1.5 shows the frequencies of syllable types by position in a word. It is important to note here that phonemes which consist of more than one segment—affricates, diphthongs, and long vowels—have been counted as only one of C (consonant) or V (vowel), respectively. The following subsections will elaborate on which sounds the Cs and Vs correspond to. Moreover, it is important to note that medial syllables have not been further distinguished by position in the word for the sake of this analysis, so anything between the second and the fifth medial syllable is treated the same. It would furthermore be possible to calculate the frequencies of one syllable type following the other, however, no such calculations have been performed here.

In all positions, CV is the most common syllable type, followed by CVC. With a very big margin, V is the next most common syllable type, which is also most common in initial syllables and least common in monosyllabic words. The cases with only a few attestations are the following:

- (15) a. Initial CVCC:  
လိန်တော့ linktang /lɪŋk.'taŋ/ ‘they try’ (try=3PL.M.A),<sup>5</sup>  
ဆီလ်နာ silvnang /silv.'naŋ/ ‘I see’ (see=IPL.A);
- b. Final CCCV:  
မိဂရီယို migryō /'mi.grjo/ ‘flourishes’ (flourish-3SG.N),  
ဆီလ်နာ subryō /'su.brjo/ ‘ceases’ (cease-3SG.N);
- c. Single V:  
အီ ay /a/ ‘I’ (1SG.TOP).

The medial and final VC cases may seem like an oddity, but they are mostly due to the previous syllable ending in /ŋ/, with that syllable also containing a lax vowel,

<sup>5</sup> In the dictionary as လိန်: linka-, possibly an entry changed at a later point, or simply an error in the text (Sugar Fairies).

Table 1.5: Relative frequency of syllable types per word (n = 5500)

Type	Initial		Medial		Final		Single		Total	
CV	2906	67.60%	1974	72.02%	2108	49.03%	578	48.13%	7566	60.33%
CCV	55	1.28%	24	0.88%	47	1.09%	32	2.66%	158	1.26%
CCCV	—	—	—	—	2	0.05%	—	—	2	0.02%
CVC	751	17.47%	614	22.40%	1905	44.31%	298	24.81%	3568	28.45%
CCVC	29	0.67%	10	0.36%	86	2.00%	9	0.75%	134	1.07%
CVCC	2	0.05%	—	—	—	—	—	—	2	0.02%
V	488	11.35%	95	3.47%	67	1.56%	2	0.17%	652	5.20%
VC	68	1.58%	24	0.88%	84	1.95%	282	23.48%	458	3.65%
Total	4299	100.00%	2741	100.00%	4299	100.00%	1201	100.00%	12540	100.00%

which means that this syllable must be closed. An alternative explanation would be to assume that /ŋ/ is ambisyllabic, or actually /n.g ~ ŋ.g/, but realized as [ŋ]. The high number of single-syllable VC is due to *ᐱᓃ ang* ‘AT’, which alone appears 255 times in the sample (4.63% of all words, 21.23% of monosyllabic words, 90.43% of monosyllabic VC words).

### Phonemic Makeup of Initial Syllables

The statistics in the following sections have been gathered from the IPA conversions of translated texts and dictionary entries mentioned above. The transcribed words have been split into syllables and then the collected contents of each position group were written into separate plain text files, one each for:

- all initial syllables of polysyllabic words,
- all medial syllables of polysyllabic words,
- all final syllables of polysyllabic words, and
- all monosyllabic words.

Monosyllabic words are both initial and final syllables at the same time; they have been counted separately for the purpose of this analysis. Onsets, nuclei and codas have been matched by regular expressions; the command line tools *grep*, *sort*, and *uniq* were used to aggregate all occurring variants for each syllable segment as well as their absolute frequencies:<sup>6</sup>

```
(16) C = (?:tʃ|dʒ|[ptkbgdmnŋvshrʃjw])
      V = (?:[æɔʊ]:ɪ|[æɔʊ]ɪ|əʊ|[ieaou]:|[ieaou]ɛɔʊ)
```

As we have seen above (Table 1.5), CCV syllables only make up 1.28% of initial syllables, in so far it is no surprise that consonant clusters all appear at the bottom of Table 1.6. There also seem to be combination patterns in that initial clusters exist for all plosives plus /r/, and almost all bilabials plus /j/, with the exception of /bj/, however, /nj/ is added to the group instead. Combinations with /w/ only occur for /b/, /r/, and /s/, which do not share an obvious connection. Syllables without a consonant filling the onset position are marked with ‘Ø’; these numbers correspond to the VC and VCC rows in Table 1.5.

Perhaps most striking about the nuclei of initial syllables presented in Table 1.7 is that it is plain vowels which occur most of the time. As mentioned above, lax vowels are counted here as allophones of tense ones as their distribution is complementary, which is why the plain vowels are presented as grouped. Long vowels

<sup>6</sup> However, *sort* was unable to handle all IPA characters, so *sed 'y/ɛɪɔʊ:ʃʒŋ/EI0U@:SZN/'* had to be used to compensate by transcribing everything into X-SAMPA.

Table 1.6: Relative frequency of onsets in initial syllables (n = 4299)

Phoneme	Frequency	Percentage
Ø	556	12.93 %
s	488	11.35 %
t	432	10.05 %
m	418	9.72 %
k	380	8.84 %
n	375	8.72 %
p	334	7.77 %
b	231	5.37 %
d	172	4.00 %
v	164	3.81 %
l	159	3.70 %
r	134	3.12 %
j	126	2.93 %
g	111	2.58 %
h	99	2.30 %
tʃ	30	0.70 %
pr	27	0.63 %
nj	27	0.63 %
kr	8	0.19 %
br	8	0.19 %
tr	6	0.14 %
dʒ	4	0.09 %
gr	3	0.07 %
w	2	0.05 %
sw	1	0.02 %
rw	1	0.02 %
pj	1	0.02 %
mj	1	0.02 %
bw	1	0.02 %

Table 1.7: Relative frequency of nuclei in initial syllables (n = 4299)

Phoneme	Frequency	Percentage
a	1847	42.96 %
i	1011	23.52 %
<i>i</i>	802	18.66 %
<i>ɪ</i>	209	4.86 %
e	705	16.40 %
<i>e</i>	523	12.17 %
<i>ɛ</i>	164	3.81 %
<i>ə</i>	18	0.42 %
u	260	6.05 %
<i>u</i>	228	5.30 %
<i>ʊ</i>	32	0.74 %
o	227	5.28 %
<i>o</i>	188	4.37 %
<i>ɔ</i>	39	0.91 %
a:	109	2.54 %
aɪ	88	2.05 %
eɪ	40	0.93 %
e:	4	0.09 %
ɔɪ	3	0.07 %
ʊɪ	1	0.02 %
o:	1	0.02 %
i:	1	0.02 %
e:ɪ	1	0.02 %
aʊ	1	0.02 %

and diphthongs find themselves below the 5% threshold, and the words with single occurrences are:

- (17) a. ကွဲရ် *kuysān* ‘comparison’,  
 b. ဝဲ *nōn* ‘will, intention’,  
 c. ဝဲာ် *nīsa* ‘wanted’,<sup>7</sup>  
 d. ခွဲာ် *sēyraya* ‘will overcome’ (FUT-overcome-3SG.M),  
 e. ခိာ် *sautan* ‘cork’.

As [e:ɪ] only occurs due to allophony, it should not be counted as a phoneme for the purposes of this analysis. On the other hand, the same could be said for a lot of cases of [a:] included here—this caveat applies to all nouns derived from verbs ending in *-a* with the very common nominalizing suffix ခဲာ် *-an*, as exemplified in (10) above. Similarly, the 18 cases of /ə/ reported here are mostly from tense prefixes also mentioned above, for instance, မဲာ် *məkoronay* ‘I knew’ (PST-know=1SG.TOP).

Table 1.8: Relative frequency of codas in initial syllables (n = 4299)

Phoneme	Frequency	Percentage
Ø	3449	80.23 %
n	298	6.93 %
ŋ	235	5.47 %
r	129	3.00 %
l	88	2.05 %
m	74	1.72 %
s	20	0.47 %
h	2	0.05 %
t	1	0.02 %
ŋk	1	0.02 %
lv	1	0.02 %
k	1	0.02 %

Initial-syllable codas (Table 1.8) are far less diverse than consonant onsets: there are only 10 attested segments in comparison to 28 for onsets (not counting empty codas of C(C)V syllables, which constitute the majority by a large margin), and the only two cluster attested are /ŋk/ in the word လိာ်ကံ *linktang* ‘they try’ (try=3PL.M.A),

<sup>7</sup> ဝဲာ် *nīsa* and ဝဲ *nōn* are both related to ဝဲ *no-* ‘want, plan’.

and /lv/ in the word ၼ်းလ်း *silvnang* ‘I see’ (see=IPL.A). There only being two incidences of a CC cluster is very probably an effect of the small sample size. Furthermore, the only unvoiced single coda consonants attested are /s/, /h/, /t/, and /k/, the latter two only once, /h/ twice:

- (18) a. မဲးပဝ်း *mehvāng* ‘you are supposed to’ (be.supposed.to=2SG.A),<sup>8</sup>  
           ဝဲးပဝ်း *rohtang* ‘they bite’ (bite=3SG.M.A);  
       b. ပာတလ်း *patlay* ‘cousin’;  
       c. ၼ်း-ၼ်း *sik-sik* ‘tit’.
